

AT32F413 Firmware BSP&Pack

Introduction

This application note is written to give a quick guideline on how to apply AT32F413 BSP (Board Support Package) and install AT32 Pack.

Contents

| | | |
|----------|--|-----------|
| 1 | Overview | 34 |
| 2 | How to install Pack | 35 |
| 2.1 | IAR Pack installation..... | 35 |
| 2.2 | Keil_v5 Pack installation..... | 37 |
| 2.3 | Keil_v4 Pack installation..... | 38 |
| 2.4 | Segger Pack installation..... | 41 |
| 3 | Flash algorithm file | 45 |
| 3.1 | How to use Keil algorithm file | 45 |
| 3.2 | How to use IAR algorithm files..... | 47 |
| 4 | BSP introduction..... | 51 |
| 4.1 | Quick start | 51 |
| 4.1.1 | Template project..... | 51 |
| 4.1.2 | BSP macro definitions | 52 |
| 4.2 | BSP specifications | 54 |
| 4.2.1 | List of abbreviations for peripherals | 54 |
| 4.2.2 | Naming rules | 55 |
| 4.2.3 | Encoding rules..... | 56 |
| 4.3 | BSP structure | 59 |
| 4.3.1 | BSP folder structure | 59 |
| 4.3.2 | BSP function library structure..... | 60 |
| 4.3.3 | Initialization and configuration for peripherals | 61 |
| 4.3.4 | Peripheral functions format description..... | 61 |
| 5 | AT32F413 peripheral library functions | 62 |
| 5.1 | HICK automatic clock calibration (ACC) | 62 |
| 5.1.1 | acc_calibration_mode_enable function..... | 63 |
| 5.1.2 | acc_step_set function | 63 |
| 5.1.3 | acc_interrupt_enable function | 64 |
| 5.1.4 | acc_hicktrim_get function..... | 65 |

| | |
|---|----|
| 5.1.5 acc_hickcal_get function | 65 |
| 5.1.6 acc_write_c1 function..... | 66 |
| 5.1.7 acc_write_c2 function..... | 66 |
| 5.1.8 acc_write_c3 function..... | 67 |
| 5.1.9 acc_read_c1 function | 67 |
| 5.1.10 acc_read_c2 function | 68 |
| 5.1.11 acc_read_c3 function | 68 |
| 5.1.12 acc_flag_get function | 69 |
| 5.1.13 acc_flag_clear function | 70 |

1 Overview

In order to allow users to use Artery MCU in an efficiently and quickly manner, we provide a complete set of BSP & Pack tools for the sake of application development. They include peripheral driver library, core-related documents and application cases as well as Pack documents supporting a variety of development environments, such as Keil_v5, Keil_v4, IAR_v6, IAR_v7 and IAR_v8.

This application note gives a detailed account of how to use BSP and Pack.

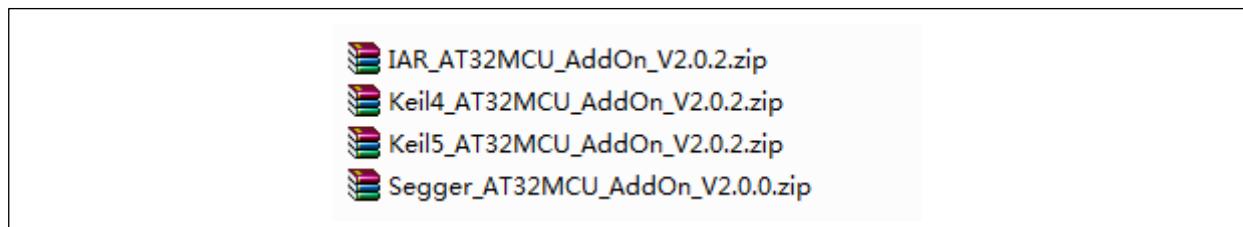

2 How to install Pack

ArteryTek provides a complete set of Pack documents that support various development environments such as Keil_v5, Keil_v4, IAR_v6, IAR_v7 and IAR_v8. Double-click on the corresponding Pack to finish one-stop installation.

Note: This section takes AT32F403A as an example, and other AT32 MCUs have similar Pack installation methods.

The pack installation documents are as follows (the specific version information is subject to the actual conditions):

Figure 1. Pack kit

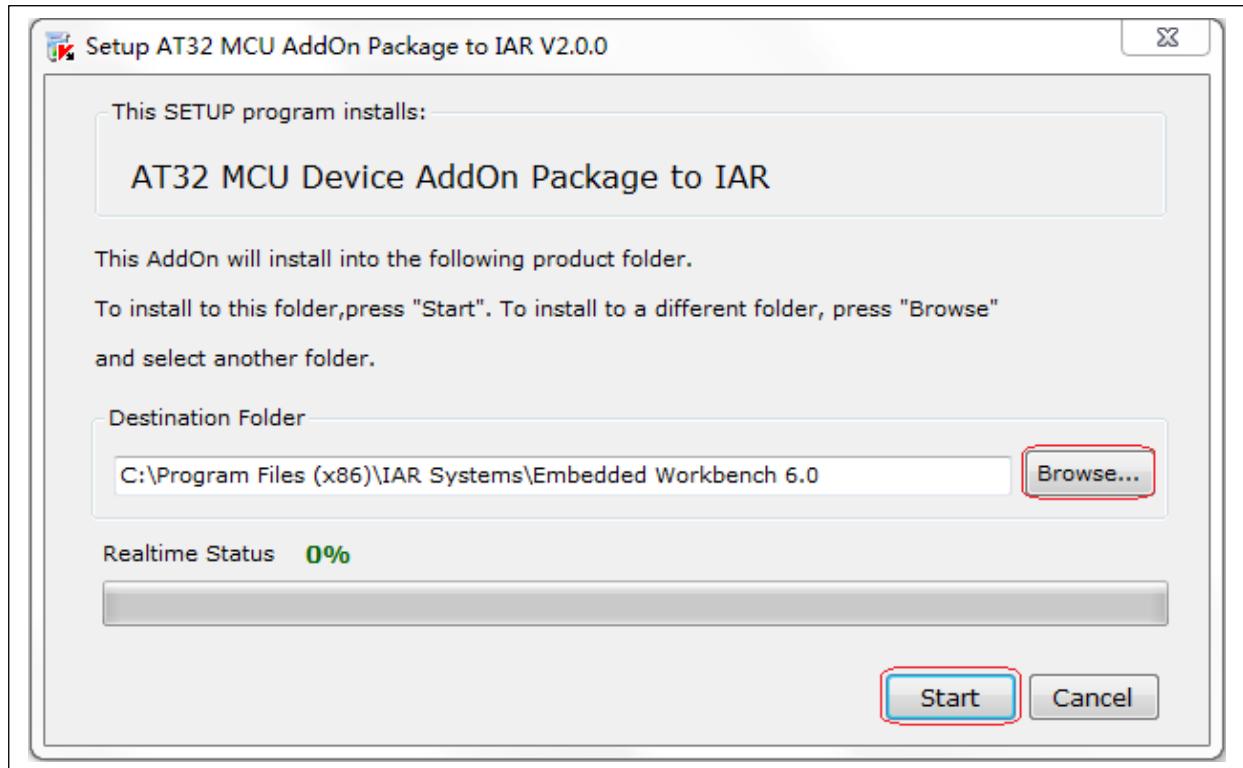

2.1 IAR Pack installation

IAR_AT32MCU_AddOn.zip: This is a zip file supporting IAR_V6, IAR_V7 and IAR_V8 Follow the steps below to install:

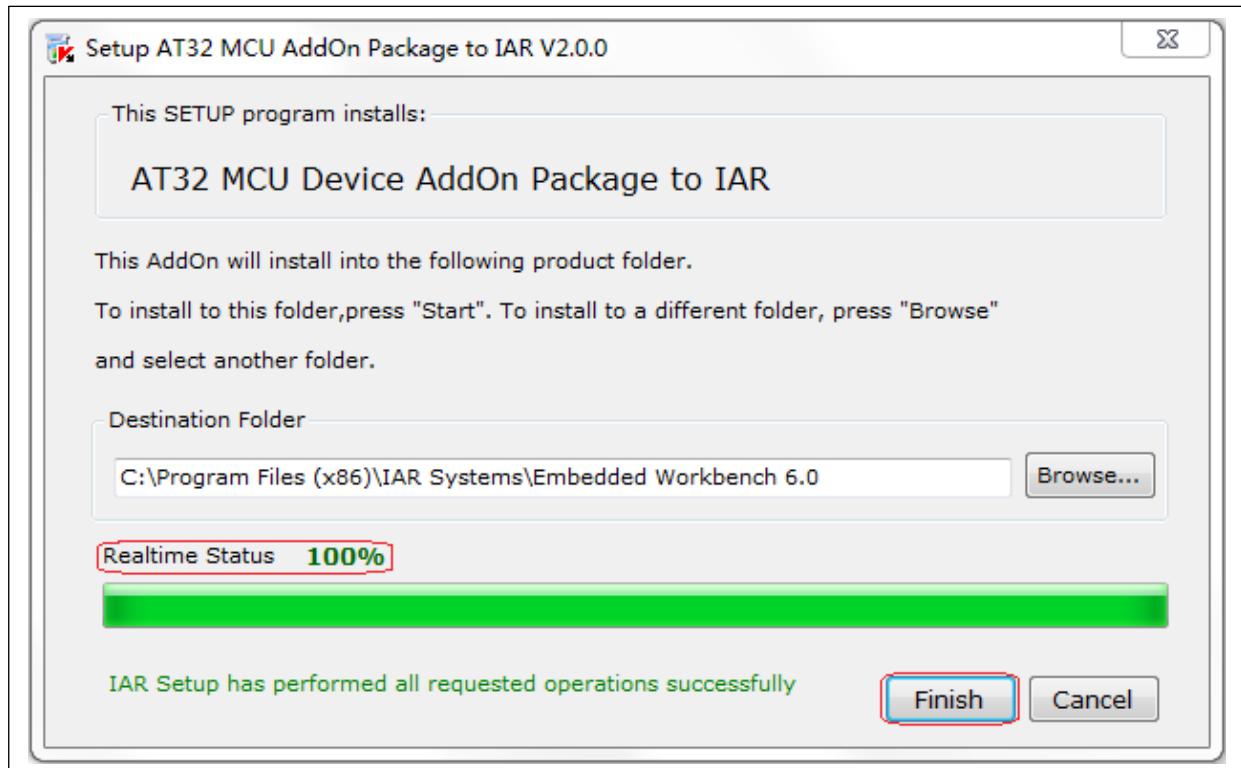

- ① Unzip *IAR_AT32MCU_AddOn.zip*
- ② Double click on *IAR_AT32MCU_AddOn.exe*, and a dialogue box pops up (the specific version information is subject to the actual conditions).

Figure 2. IAR Pack installation window

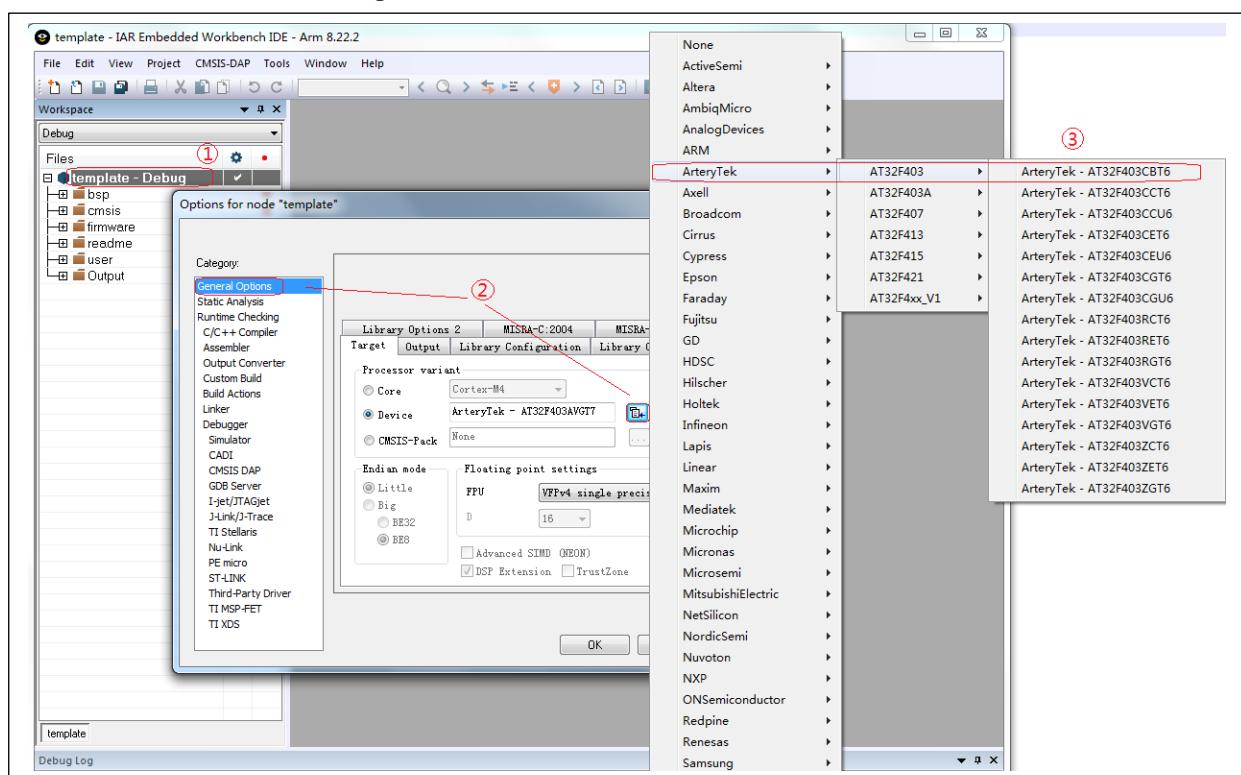

Note: If the installation path of IAR does not match the Destination Folder, click on "Browse" to select a correct path, then click on "Start", as shown below.

Figure 3. IAR Pack installation

- ③ Click on “Finish”
- ④ To check whether the IAR Pack is installed successfully or not, open an IAR project and follow the steps below:
 - Right click on a project name, and select “Options...”
 - Select “General Options”, and click on the check box
 - Click on “ArteryTek” and view AT32 MCU-related information

Figure 4. View IAR Pack installation status

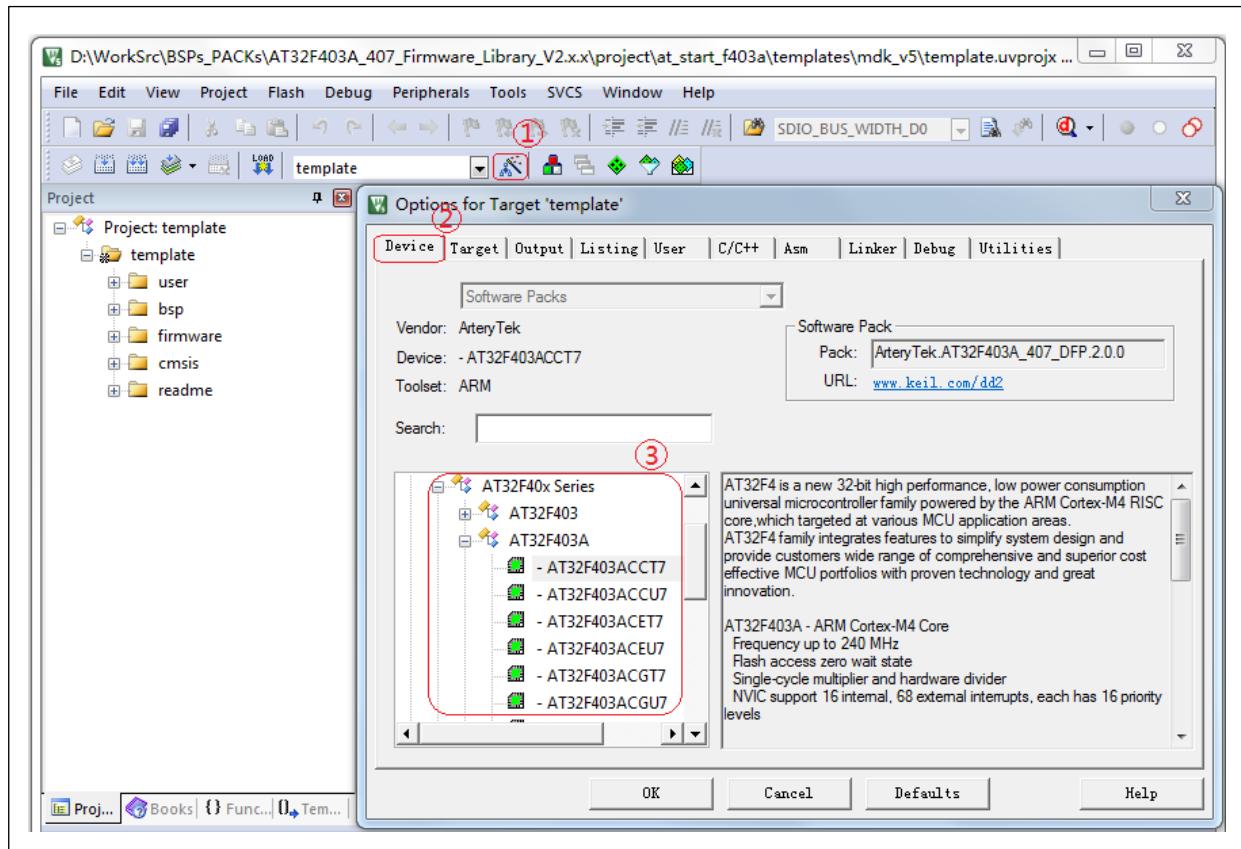

2.2 Keil_v5 Pack installation

Keil5_AT32MCU_AddOn.zip: This is a zip file supporting Keil_v5. Follow the steps below to install:

- ① Unzip Keil5_AT32MCU_AddOn.zip. This zip file includes all Keil5 packs supported, all of which are standard Keil_v5 DFP installation files.
- ② Select the desired Pack, and double click on *ArteryTek.AT32xxxx_DFP.2.x.x.pack* to get one-stop installation.
- ⑤ To check whether the Keil_v5 Pack is installed successfully or not, follow the steps below:
 - Click on wand
 - Select “Device”
 - View AT32 MCU-related information

Figure 5. View Keil_v5 Pack installation status

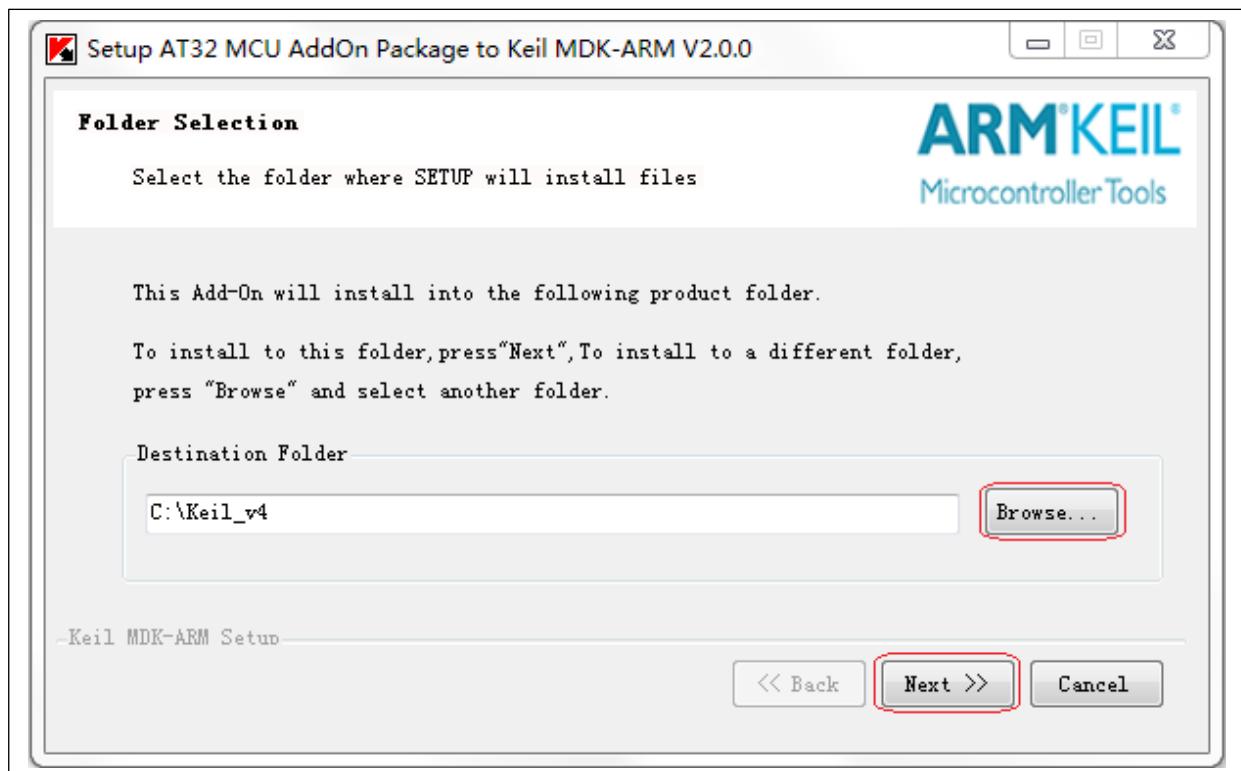

2.3 Keil_v4 Pack installation

Keil4_AT32MCU_AddOn.zip: This is a zip file supporting Keil_v4. Follow the steps below to finish installation.

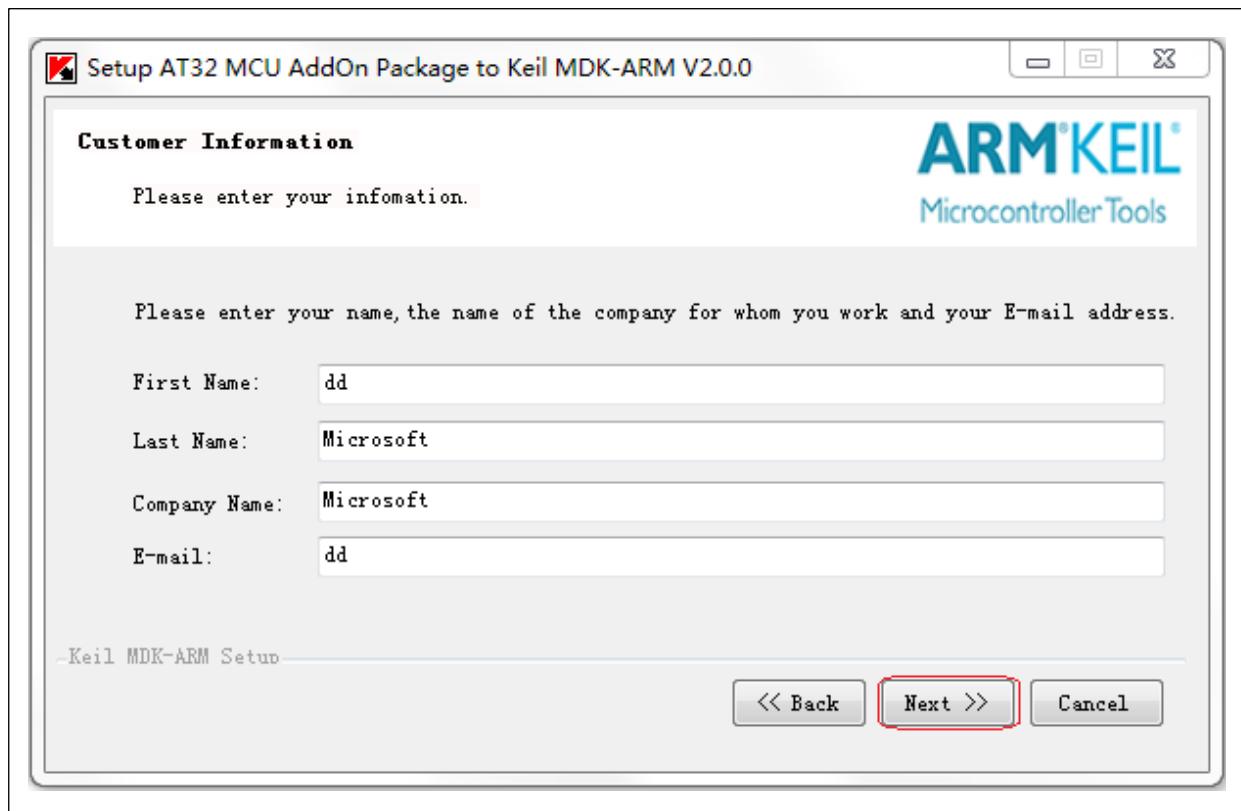

- ① Unzip Keil4_AT32MCU_AddOn.zip
- ② Double click on *Keil4_AT32MCU_AddOn.exe*, and a dialog box pops up below (the specific version information is subject to the actual conditions).

Figure 6. Keil_v4 Pack installation window

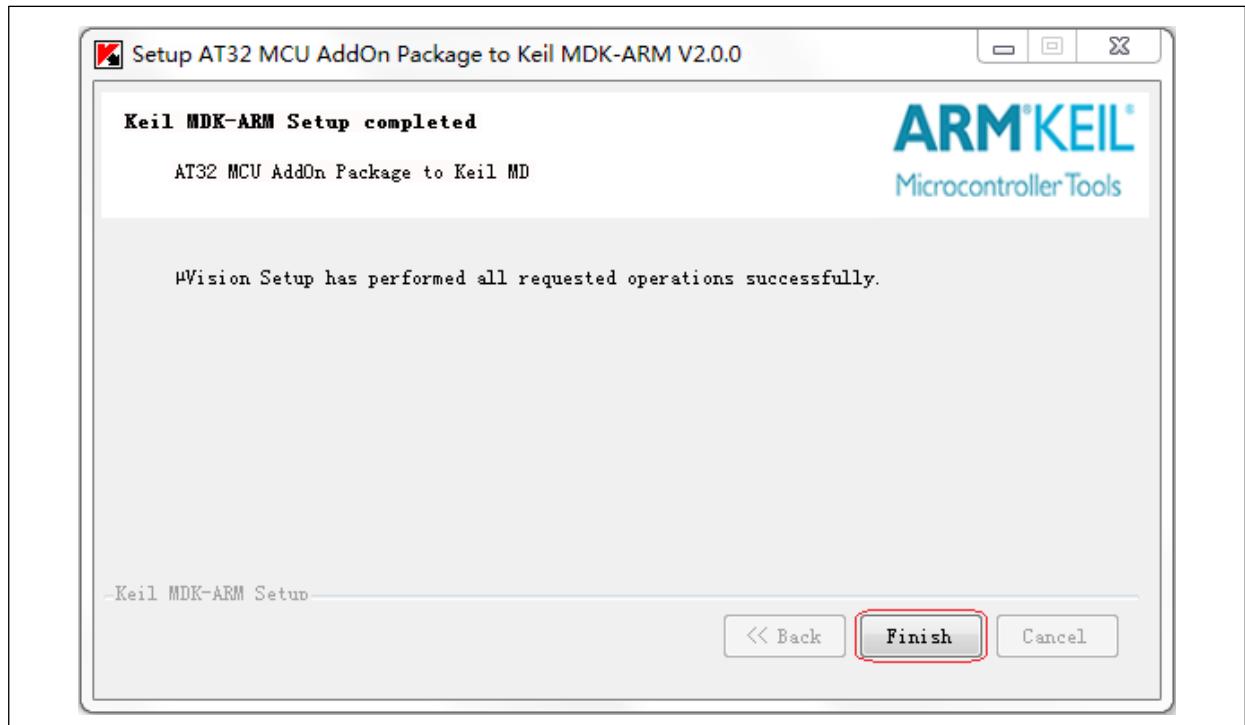

- ③ If the installation path of Keil_v4 does not match the “Destination Folder”, click on “Browse” to select the actual correct path, then click on “Next”, as shown below.

Figure 7. Keil_v4 Pack installation process

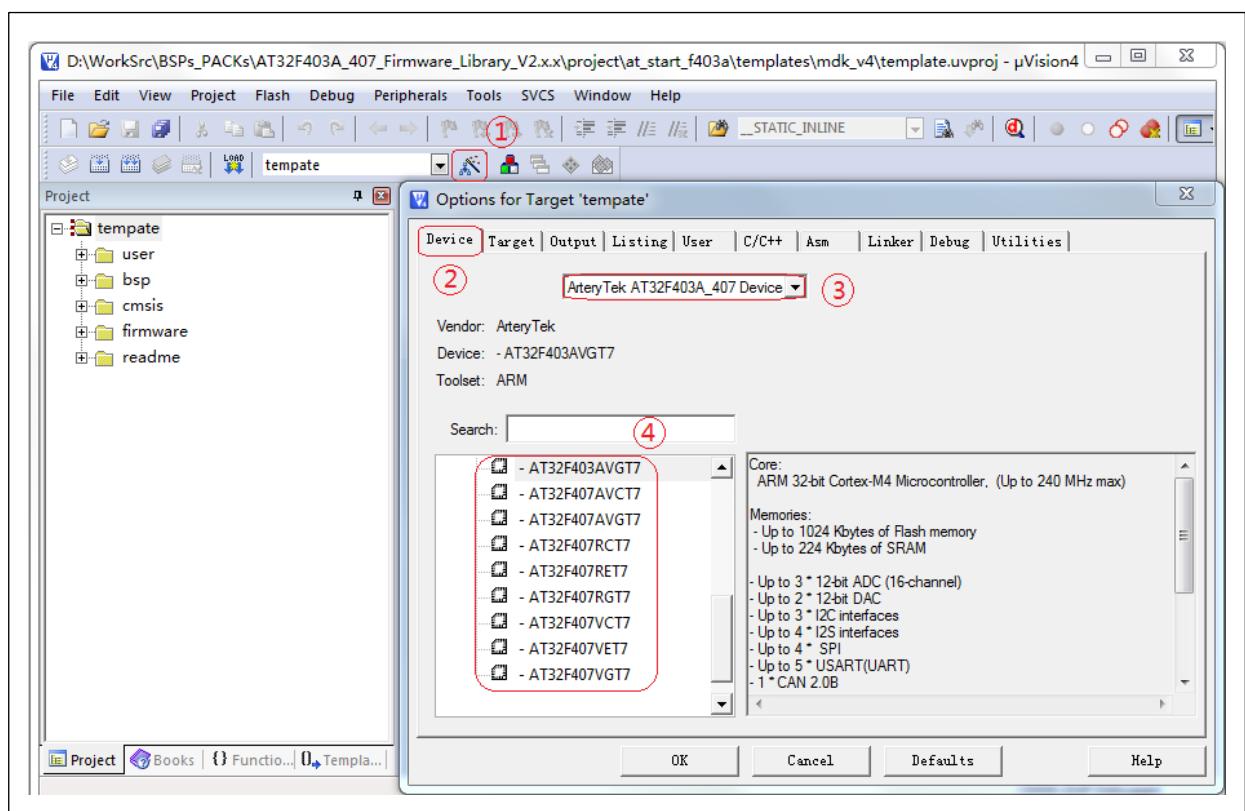

- ④ In the above “Customer Information” window, you can make some changes, but usually it is unnecessary. Then click on “Next” to start installation. The installation result is as follows.

Figure 8. Keil_v4 Pack installation complete

- ⑤ Click on “Finish”. To check whether Keil_v4 Pack is installed successfully or not, follow the below steps:
 - Click on wand
 - Select “Device”
 - Select the desired pack file
 - View ArteryTek-related information

Figure 9. View Keil_v4 Pack installation status

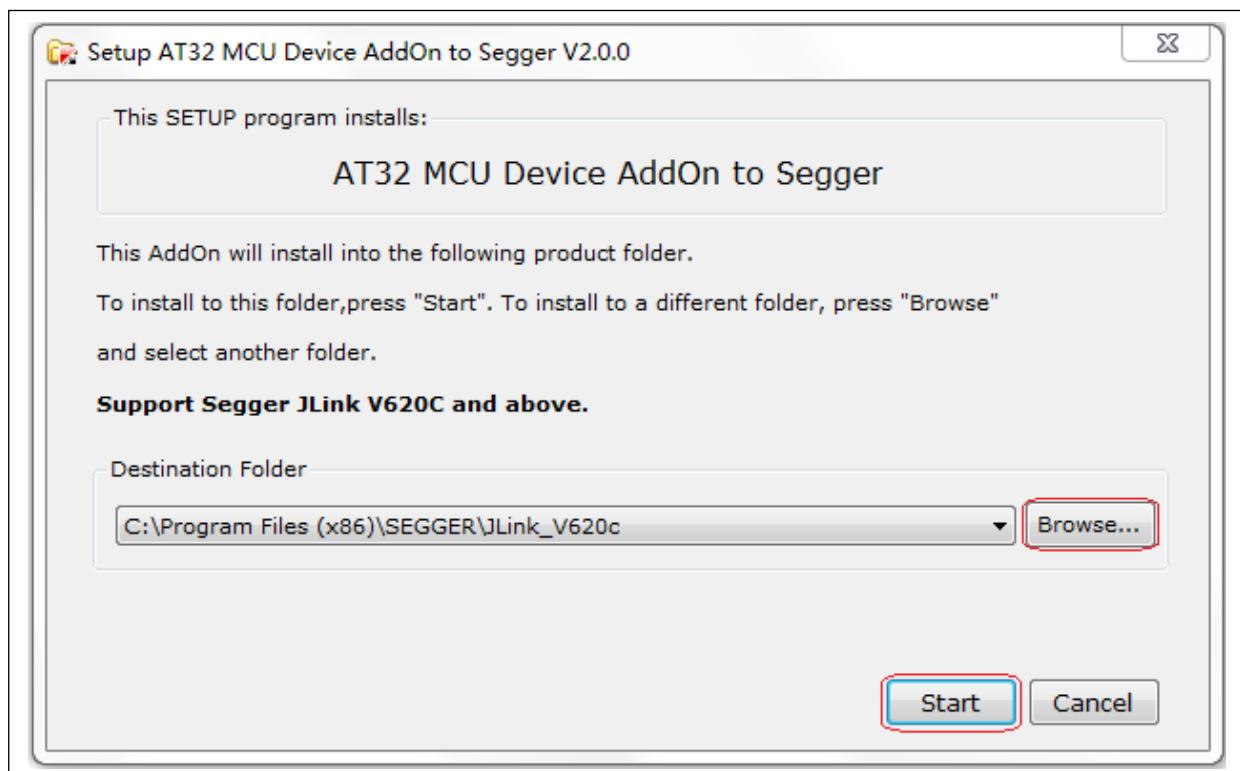

2.4 Segger Pack installation

Segger_AT32MCU_AddOn.zip: This is used to download J-Flash. Follow the steps below to install.

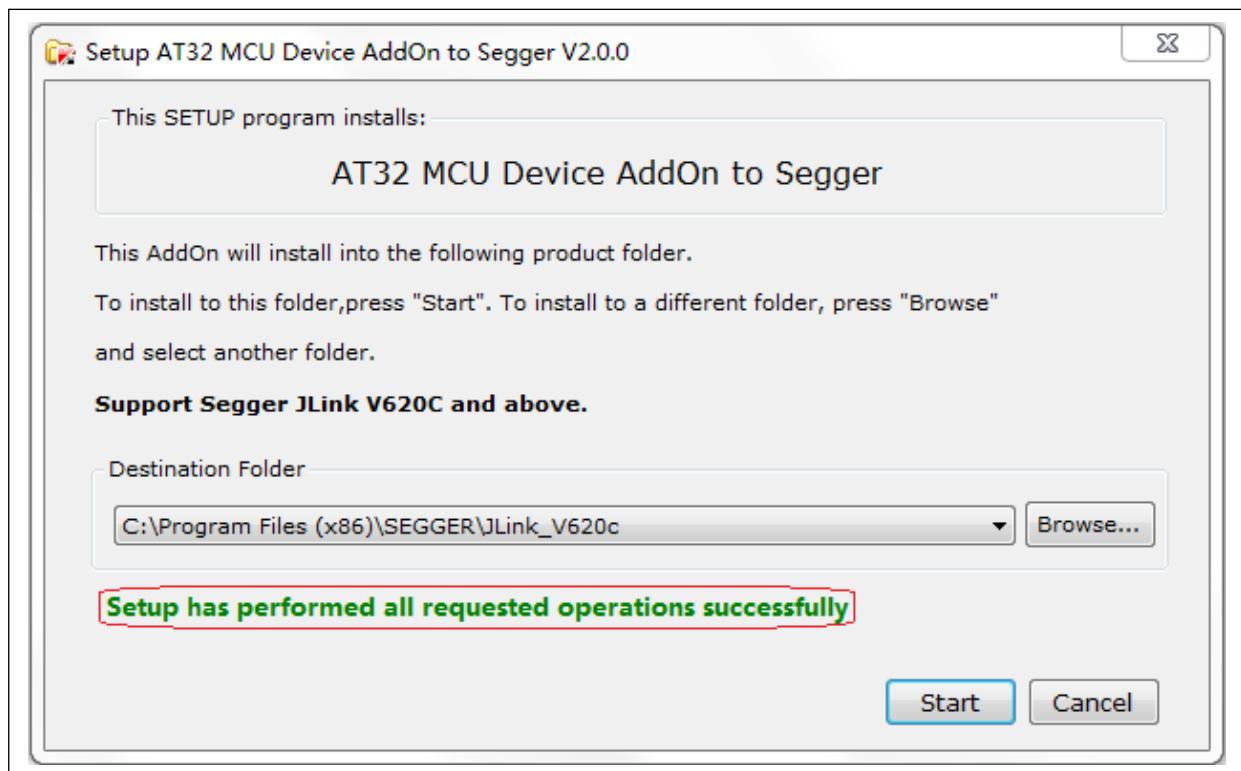

- ① Unzip Segger_AT32MCU_AddOn.zip
- ② Double click on *Segger_AT32MCU_AddOn.exe*, and a dialog box pops up below (the specific version information is subject to the actual conditions)

Figure 10. Segger pack installation window

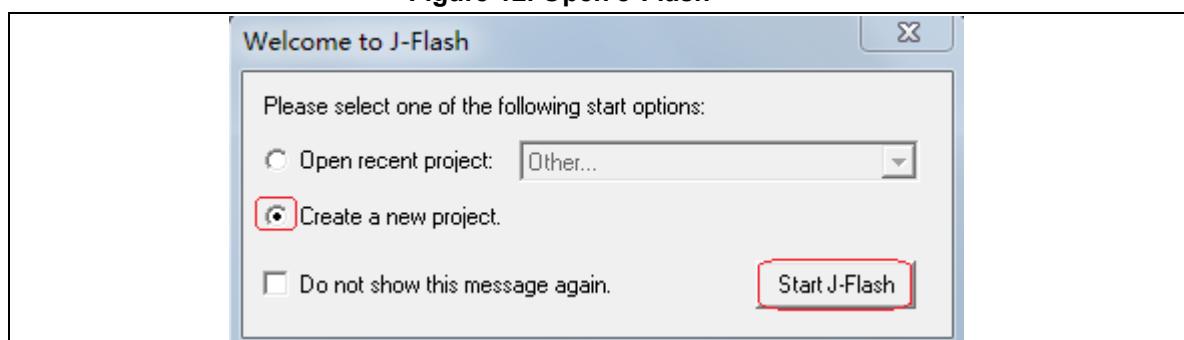

Note: If the installation path of Segger does not match the “Destination Folder”, click on “Browse” to select a correct path, then click on “Start”, as shown below.

Figure 11. Segger pack installation process

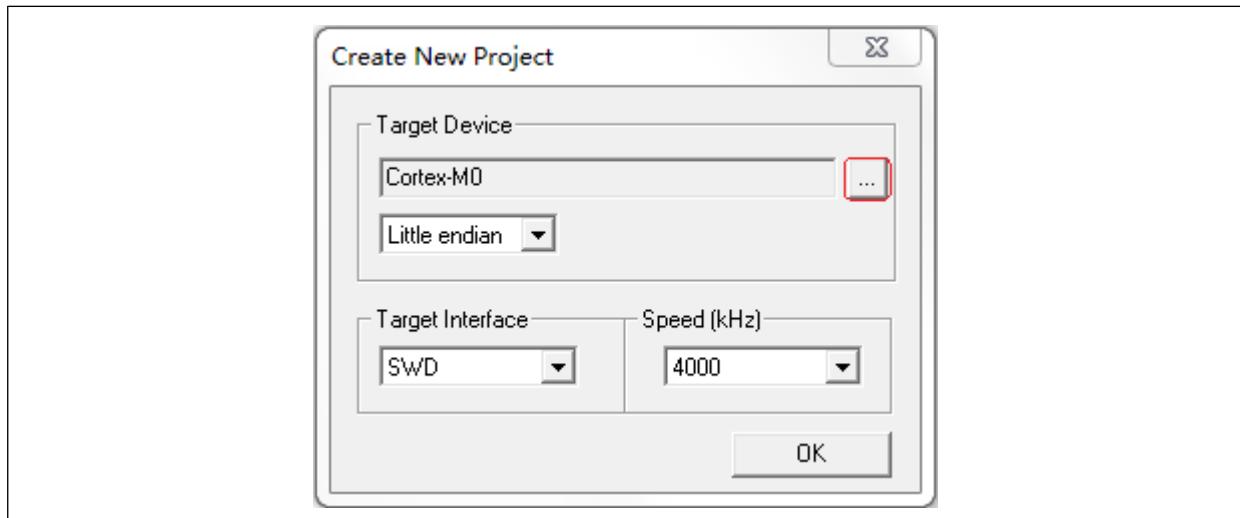

- ③ If the “Setup has performed all requested operations successfully” appears, it indicates successful installation. To check whether the installation is successful or not, follow the steps below:
- Open J-Flash.exe, a dialog box appears, tick “Create a new project” and click on “Start J-Flash”:

Figure 12. Open J-Flash

- After “Start J-Flash”, click on the check box under “Target Device”:

Figure 13. Create a new project using J-Flash

- Drag the scroll bar up and down in the check box. If the ArteryTek-related information and algorithm documents can be found, the installation is successful, as shown below:

Figure 14. View Device information

3 Flash algorithm file

Flash algorithm files are included in the Pack for online download through IDE tools such as KEIL/IAR. This section describes how to use Flash algorithm files.

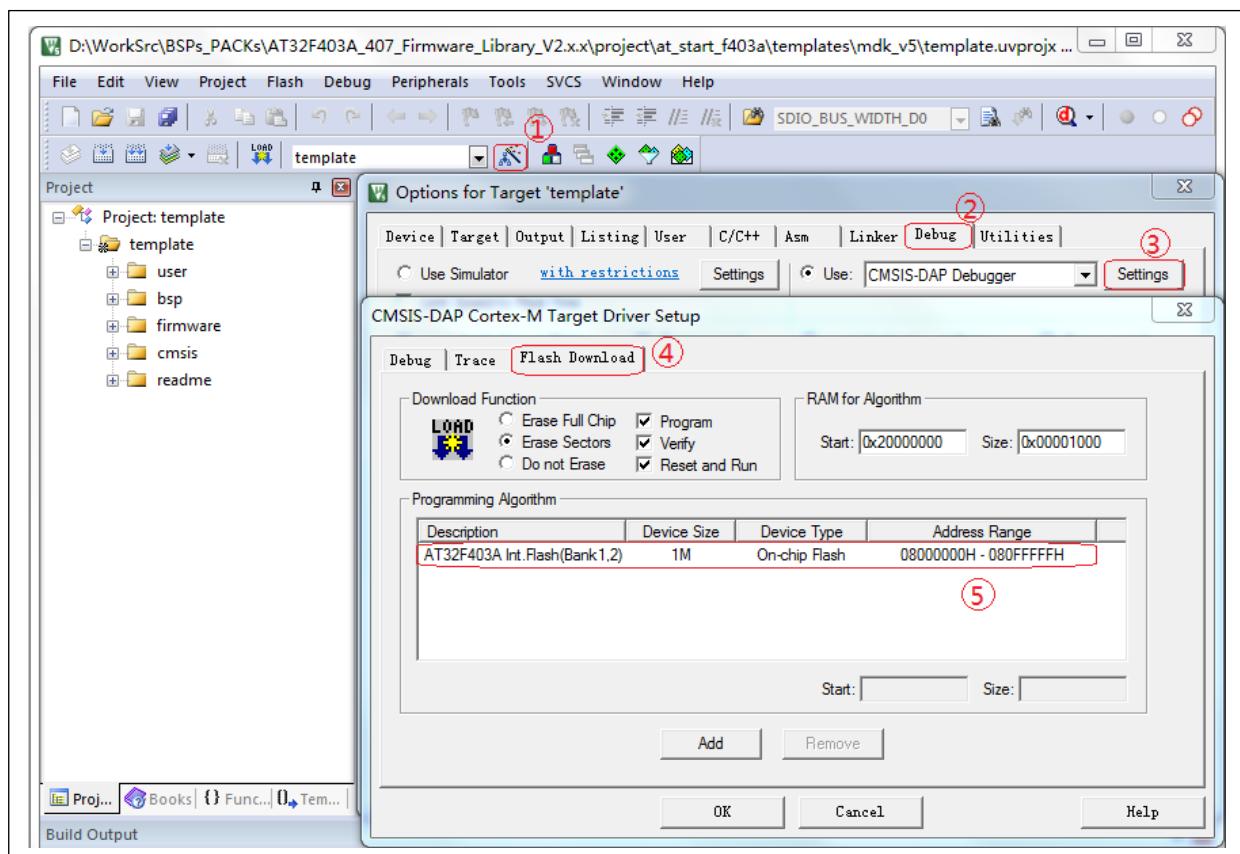

Note: AT32 MCUs have similar Flash algorithms, and this section uses AT32F403A as an example.

3.1 How to use Keil algorithm file

Common IDE tools such as Keil_v4 and Keil_v5 adopt a similar method to select and use the algorithm files. Here we take Keil_v5 as an example.

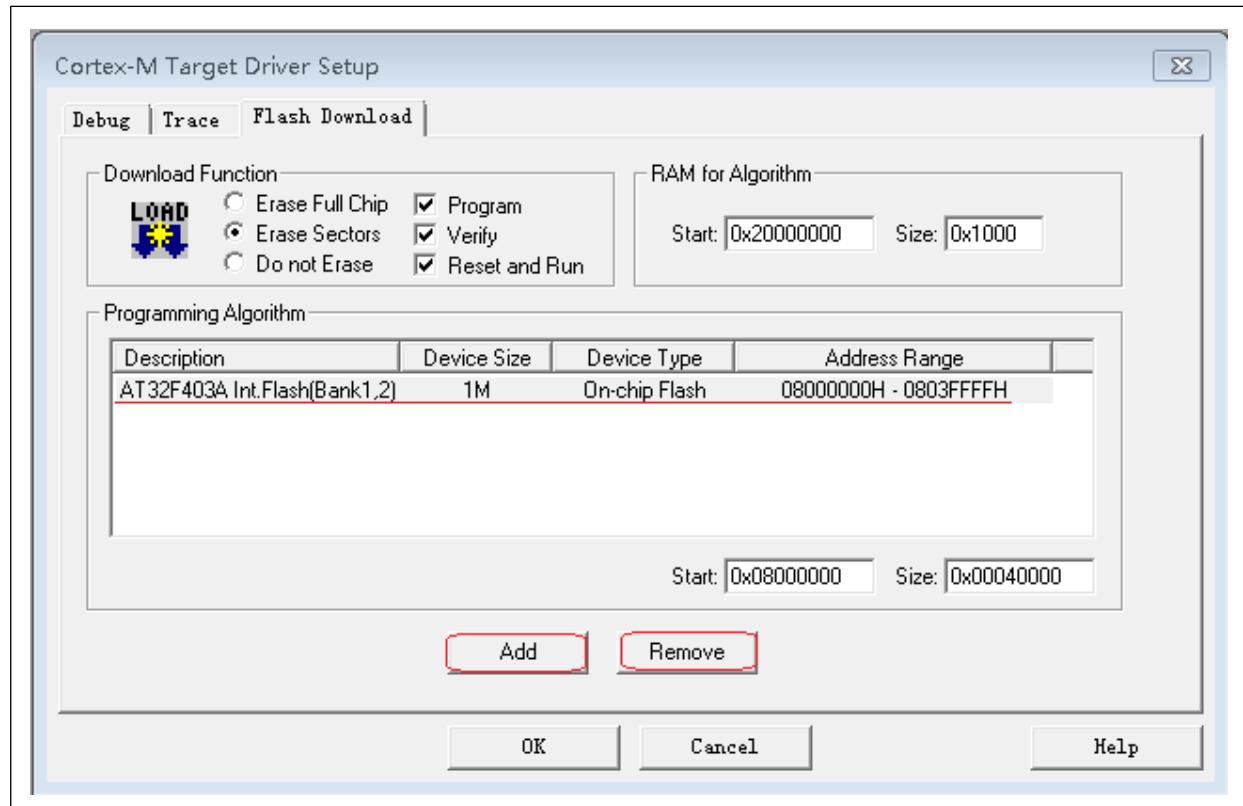

After creating a Keil IDE development tool project, the user can start Debug configuration and select the Flash algorithms. Go to *wand*—>*Debug*—>*Settings*—>*Flash Download*, as shown below:

Figure 15. Keil algorithm file settings

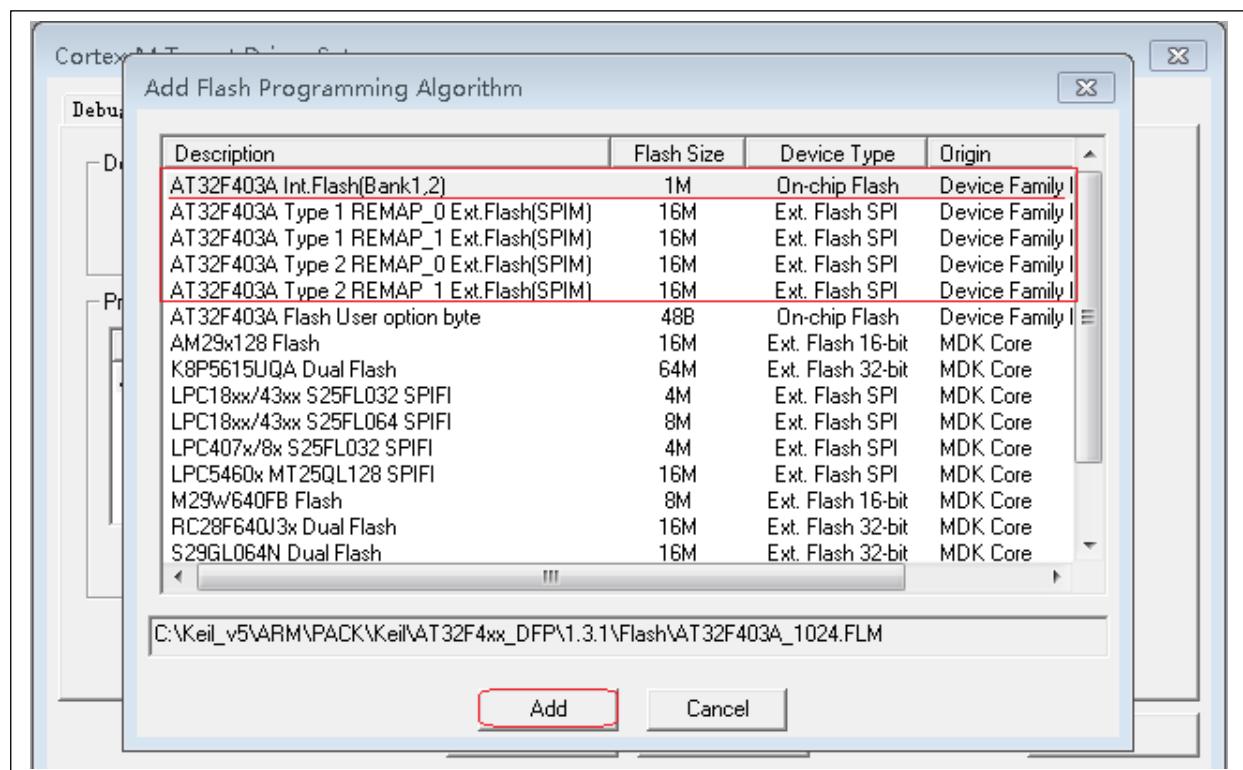

In this example, the selected Flash algorithm file is the default one. To change or remove it, click on this algorithm file, then click on *Add* or *Remove*. If the selected algorithm does not match the MCU, please follow the method below to modify.

Figure 16. Keil algorithm file configuration

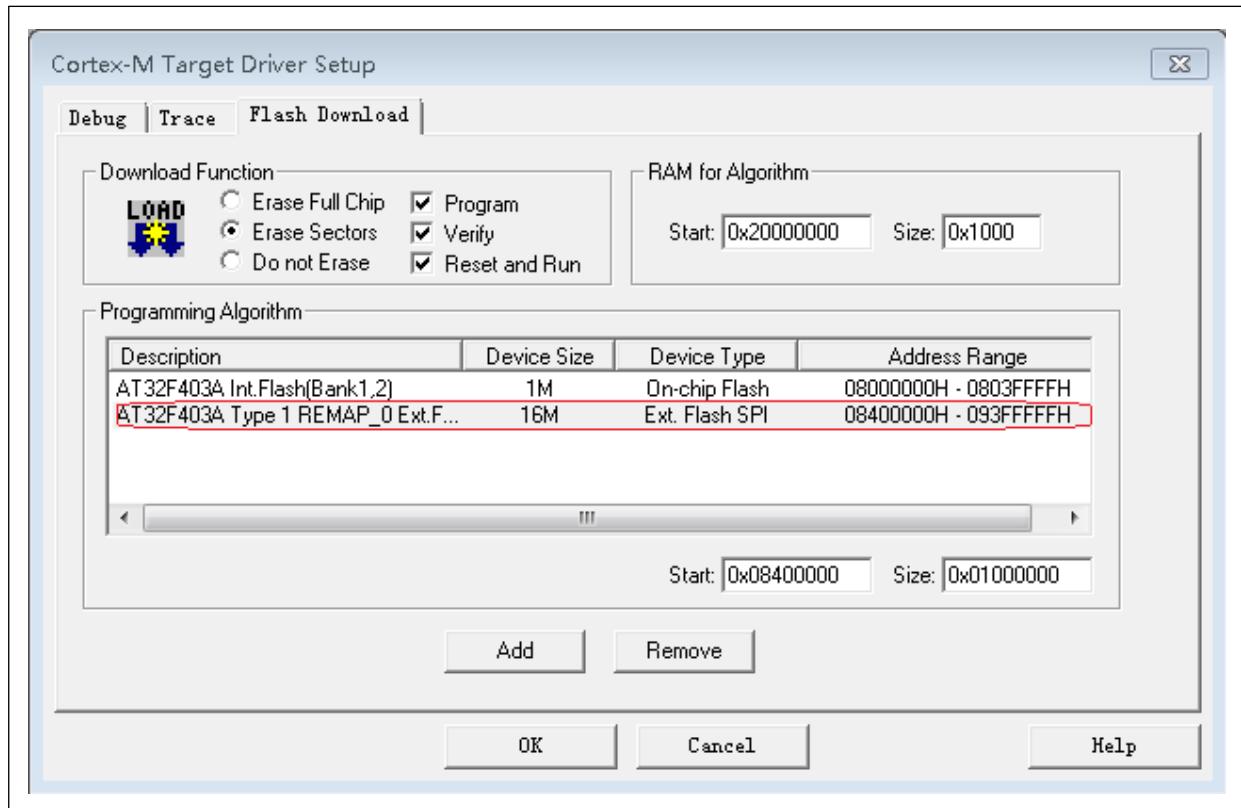

Click on *Remove* to remove the existing algorithm from the configuration, then click on *Add* to view the algorithm files associated with a MCU model and select them, as shown below:

Figure 17. Select algorithm files using Keil

After selection, click on *Add* to add the selected algorithm files into the current configuration. For example, a new SPIFI algorithm is added into the project.

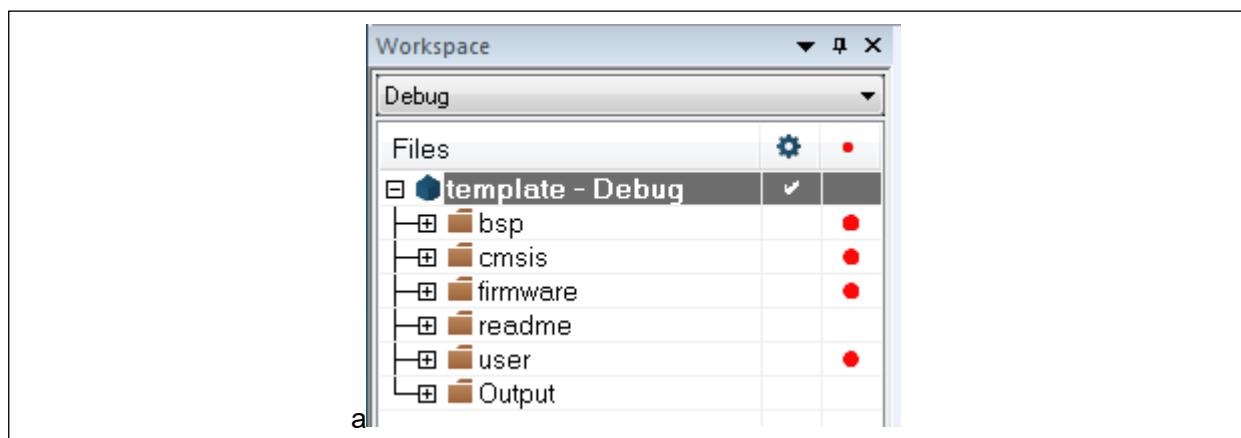

Figure 18. Add algorithm files using Keil

3.2 How to use IAR algorithm files

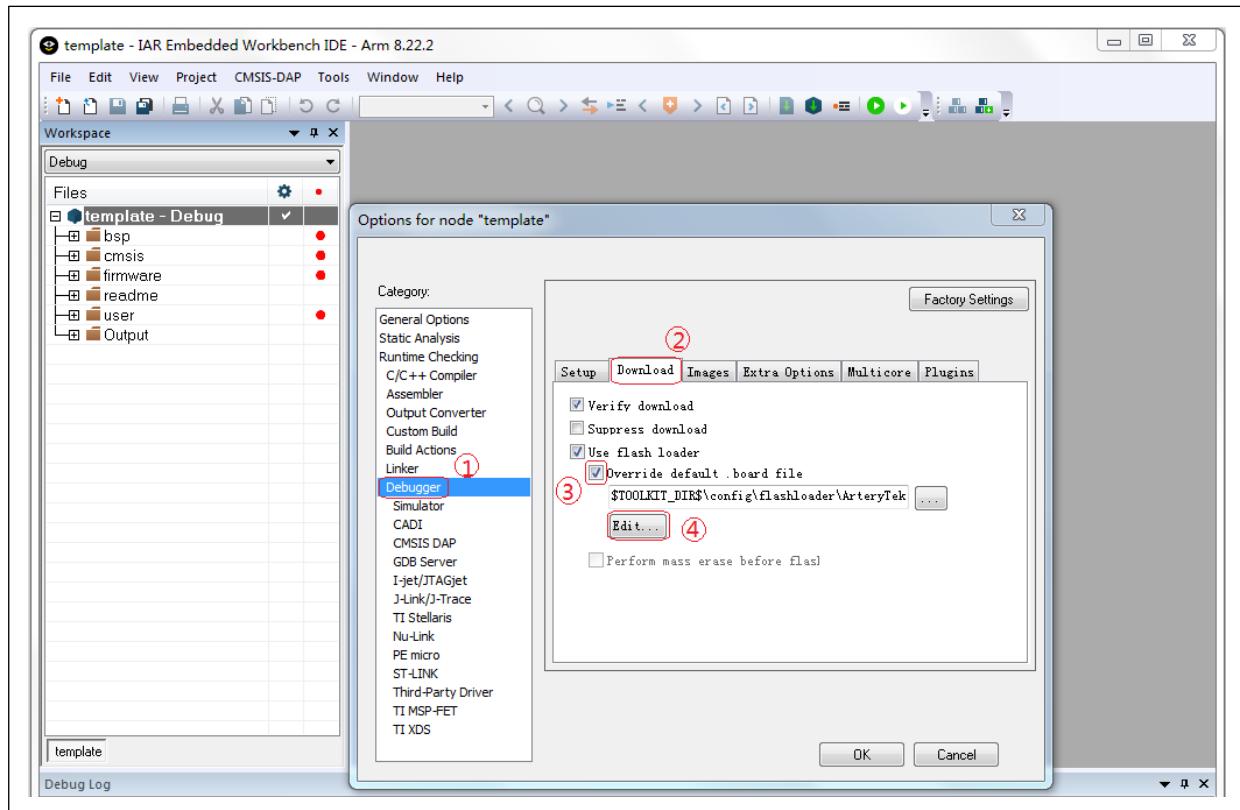

In IAR environment, the Flash algorithm files are automatically selected according to the selected MCU model during a new project configuration. To configure/modify an algorithm file manually, right-click on the file name (after an IAR project is created) in the following gray box:

Figure 19. IAR project name

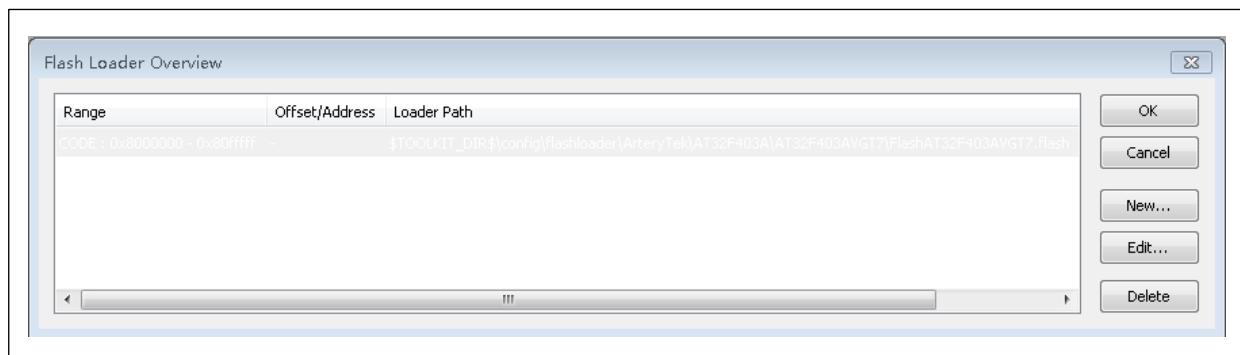

Go to Options—>Debugger—>Download—>Tick Override default .board file—>Click on Edit, as shown below:

Figure 20. IAR algorithm file configuration

Then the following window will be displayed.

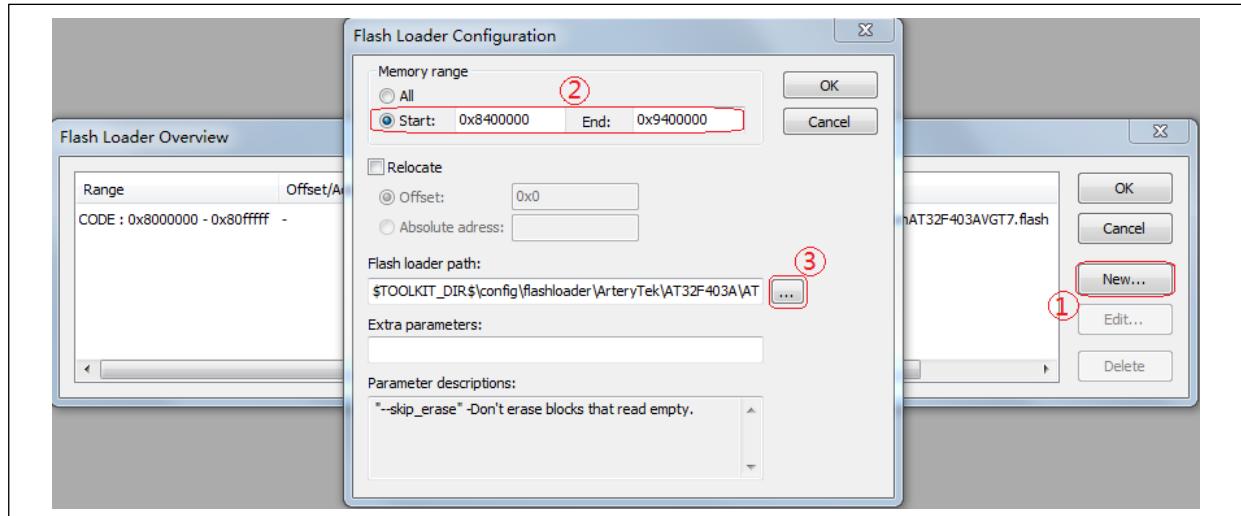

Figure 21. IAR Flash Loader Overview

Flash algorithm configuration is designated by default after selecting a MCU part number. To modify it, click on New/Edit/Delete.

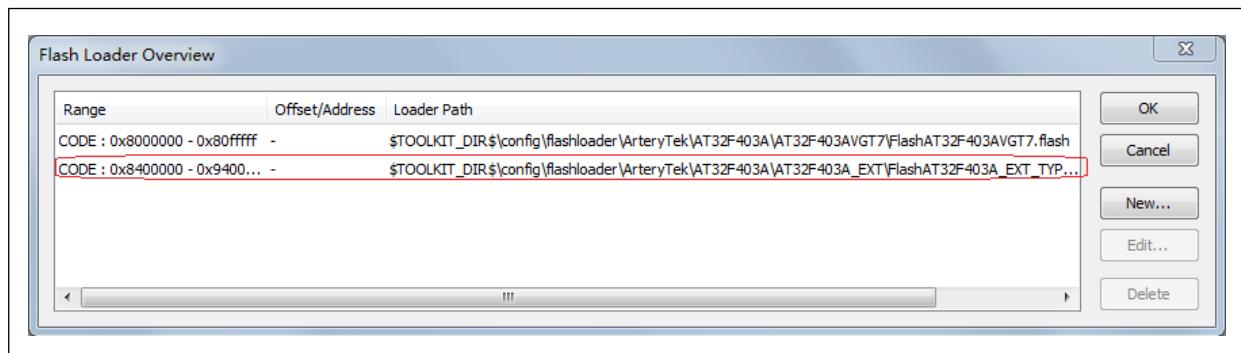

For example, click on New—>2. Memory range—>3. Select a Flash algorithm file, as shown below:

Figure 22. IAR Flash Loader configuration

This example shows how to add a SPIM Flash algorithm file. The user needs to select the corresponding MCU part number and a correct Flash algorithm file. The selected Flash algorithm configuration file is installed into IAR development environment using IAR_AT32MCU_AddOn tool. After a successful configuration, a new SPIM Flash algorithm is shown below:

Figure 23. IAR Flash Loader configuration success

1. Description of SPIM algorithms

Some Artery MCUs support Bank3 (refer to the Reference Manual or Datasheet on Artery official website for details), which can be used as an expansion of Flash memory in case of insufficient internal Flash or special application requirements. When the compiling addresses of some code or data are stored in the SPIM, these algorithm files are used for external Flash programming during online IDE tool download.

Naming rules of Artery SPIM algorithm file: AT32F4xxTypeNREMAP_P Ext.Flash.

N=1,2

P=0,1

TYPEN: External SPI Flash. Select it according to the external Flash type and part number. Refer to the FLASH_SELECT register section of the corresponding MCU Reference Manual.

REMAP_P: Select multiplex-function MCU SPIM PIN. Select it according to the connection method of pins connected to external Flash. Refer to the external SPIF remapping section in the corresponding MCU reference manual.

REMAP0: EXT_SPIF_GRMP=000

REMAP1: EXT_SPIF_GRMP=001

4 BSP introduction

4.1 Quick start

4.1.1 Template project

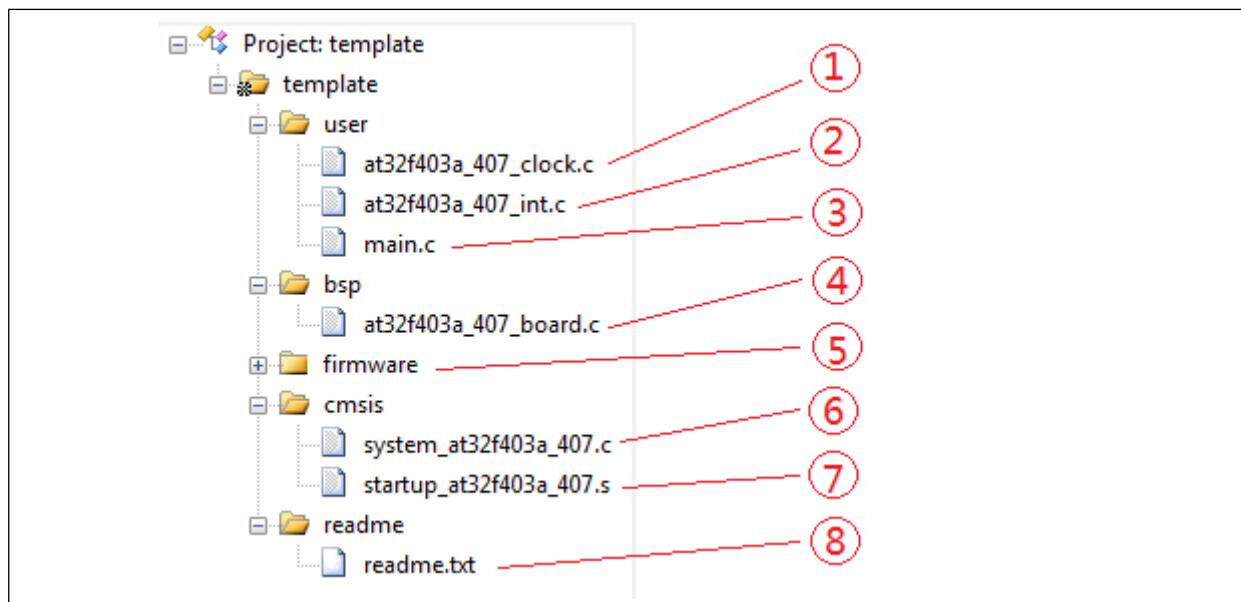

Artery firmware library BSP comes with a series of template projects built around Keil and IAR. For example, the template project of AT32F403A/407 series is located in `AT32F403A_407_Firmware_Library_V2.x.x/project/at_start_xxx/templates`.

Figure 24. Template content

| | | |
|------------|----------------|--------|
| iar_v6.10 | 21/05/24 16:03 | 文件夹 |
| iar_v7.4 | 21/05/24 16:03 | 文件夹 |
| iar_v8.2 | 21/05/24 16:03 | 文件夹 |
| inc | 21/05/24 16:03 | 文件夹 |
| mdk_v4 | 21/05/24 16:03 | 文件夹 |
| mdk_v5 | 21/05/24 16:03 | 文件夹 |
| src | 21/05/24 16:03 | 文件夹 |
| readme.txt | 21/05/21 11:15 | TXT 文件 |

The above template project includes various versions such as Keil_v5, Keil_v4, IAR_6.10, IAR_7.4 and IAR_8.2. Of those, “inc” and “src” folders contain header files and source code files. Open a corresponding folder and click on the corresponding file to open an IDE project. Figure 25 presents an example of Keil_v5 template project (its details and version are subject to the actual firmware library).

Figure 25. Keil_v5 template project example

The contents in a project include: (using AT32F403A/407 as an example, other products are similar)

- ① `at32f403a_407_clock.c` (clock configuration file) defines the default clock frequency and clock paths
- ② `at32f403a_407_int.c` (interrupt file) contains some interrupt handling codes
- ③ `main.c` contains the main code files

- ④ at32f403a_407_board.c (board configuration file) contains common hardware configurations such as buttons and LEDs on the AT-START-Evaluation Board
- ⑤ at32f403a_407_xx.c under firmware folder contains driver files of on-chip peripherals
- ⑥ system_at32f403a_407.c is the system initialization file
- ⑦ startup_at32f403a_407.s is a startup file
- ⑧ readme.txt is a readme file, containing functional description and configuration information

Note: AT32 MUCs share similar BSP usage method, and this section uses AT32F403A as an example.

4.1.2 BSP macro definitions

- ① To create a project, it is necessary to enable a startup code (startup_at32f403a_407.s) and open the appropriate macro definitions according to MCU part number before compiling code. Table 1 presents the correspondence between the MCUs and their macro definitions.

Table 1. Summary of macro definitions

| MCU part number | Macro definitions | PINs | Flash size (KB) |
|-----------------|-------------------|------|-----------------|
| AT32F403ACCT7 | AT32F403ACCT7 | 48 | 256 |
| AT32F403ACET7 | AT32F403ACET7 | 48 | 512 |
| AT32F403ACGT7 | AT32F403ACGT7 | 48 | 1024 |
| AT32F403ACCU7 | AT32F403ACCU7 | 48 | 256 |
| AT32F403ACEU7 | AT32F403ACEU7 | 48 | 512 |
| AT32F403ACGU7 | AT32F403ACGU7 | 48 | 1024 |
| AT32F403ARCT7 | AT32F403ARCT7 | 64 | 256 |
| AT32F403ARET7 | AT32F403ARET7 | 64 | 512 |
| AT32F403ARGT7 | AT32F403ARGT7 | 64 | 1024 |
| AT32F403AVCT7 | AT32F403AVCT7 | 100 | 256 |
| AT32F403AVET7 | AT32F403AVET7 | 100 | 512 |
| AT32F403AVGT7 | AT32F403AVGT7 | 100 | 1024 |
| AT32F407RCT7 | AT32F407RCT7 | 64 | 256 |
| AT32F407RET7 | AT32F407RET7 | 64 | 512 |
| AT32F407RGT7 | AT32F407RGT7 | 64 | 1024 |
| AT32F407VCT7 | AT32F407VCT7 | 100 | 256 |
| AT32F407VET7 | AT32F407VET7 | 100 | 512 |
| AT32F407VGT7 | AT32F407VGT7 | 100 | 1024 |
| AT32F407AVCT7 | AT32F407AVCT7 | 100 | 256 |
| AT32F407AVGT7 | AT32F407AVGT7 | 100 | 1024 |

- ② In the header file (at32f403a_407.h), USE_STDPERIPH_DRIVER (macro definition) is used to determine whether the Keil RTE feature is used or not. Enabling this definition while Keil RTE is unused can prevent some versions of Keil-MDK from opening _RTE_ accidentally.
- ③ The configuration header file (at32f403a_407_conf.h) defines macro definitions that enable peripherals. The file can be used to control the use of peripherals. The peripherals can be disabled simply by masking _MODULE_ENABLED pertaining to peripherals, as shown below:

Figure 26. Peripheral enable macro definitions

```
#define CRM_MODULE_ENABLED
#define TMR_MODULE_ENABLED
#define RTC_MODULE_ENABLED
#define BPR_MODULE_ENABLED
#define GPIO_MODULE_ENABLED
#define I2C_MODULE_ENABLED
#define USART_MODULE_ENABLED
#define PWC_MODULE_ENABLED
#define CAN_MODULE_ENABLED
#define ADC_MODULE_ENABLED
#define DAC_MODULE_ENABLED
#define SPI_MODULE_ENABLED
#define DMA_MODULE_ENABLED
#define DEBUG_MODULE_ENABLED
#define FLASH_MODULE_ENABLED
#define CRC_MODULE_ENABLED
#define WWDT_MODULE_ENABLED
#define WDT_MODULE_ENABLED
#define EXINT_MODULE_ENABLED
#define SDIO_MODULE_ENABLED
#define XMC_MODULE_ENABLED
#define USB_MODULE_ENABLED
#define ACC_MODULE_ENABLED
#define MISC_MODULE_ENABLED
#define EMAC_MODULE_ENABLED
```

The at32f403a_407_conf.h also defines the HEXT_VALUE (high-speed external clock value), which should be modified accordingly when changing an external high-speed crystal oscillator.

- ④ The system clock configuration file (at32f403a_407_clock.c/.h) defines the default system clock frequency and clock paths. The user, if needed, can customize the frequency multiplication process and factors, or generate corresponding clock configuration files using the clock configuration host of ArteryTek.

4.2 BSP specifications

The subsequent sections give a description of BSP specifications.

4.2.1 List of abbreviations for peripherals

Table 2. List of abbreviations for peripherals

| Abbreviations | Description |
|---------------|---|
| ADC | Analog-to-digital converter |
| BPR | Battery powered register |
| CAN | Controller area network |
| CRC | CRC calculation unit |
| CRM | Clock and reset manage |
| DAC | Digital-to-analog converter |
| DMA | Direct memory access |
| DEBUG | Debug |
| EXINT | External interrupt/event controller |
| GPIO | General-purpose I/Os |
| IOMUX | Multiplexed I/Os |
| I2C | Inter-integrated circuit interface |
| NVIC | Nested vectored interrupt controller |
| PWC | Power controller |
| RTC | Real-time clock |
| SPI | Serial peripheral interface |
| I2S | Inter-IC Sound |
| SysTick | System tick timer |
| TMR | Timer |
| USART | Universal synchronous asynchronous receiver transmitter |
| WDT | Watchdog timer |
| WWDT | Window watchdog timer |
| XMC | External memory controller |

4.2.2 Naming rules

The naming rules for BSP are described as follows:

“ip” indicates an abbreviation of a peripheral, for example, ADC, TMR, GPIO, etc., regardless of upper and lower case letters, such as adc, tmr, gpio.

- **Source code file**

The file name starts with “at32fxxx_ip.c”, for example, at32f403a_407_adc.c.

- **Header file**

The file name starts with “at32fxxx_ip.h”, for example, at32f403a_407_adc.h.

- **Constant**

If it is used in a single one file, the constant is then defined in this file; if it is used in multiple files, the constant is defined in corresponding header file.

All constants are in written in English capital letters.

- **Variable**

If it is used in a single one file, the variable is then defined in this file; if it is used in multiple files, the variable is declared with “extern” in the corresponding header file.

- **Naming rules for functions**

The peripheral functions are named based on the rule of **“peripheral abbreviation_attribute_action”** or **“peripheral abbreviation_action”**.

The commonly used functions are as follows:

| Function type | Naming rule | Example |
|---|----------------------|-----------------------|
| Peripheral reset | ip_reset | adc_reset |
| Peripheral enable | ip_enable | adc_enable |
| Peripheral structure parameter initialize | ip_default_para_init | spi_default_para_init |
| Peripheral initialize | ip_init | spi_init |
| Peripheral interrupt enable | ip_interrupt_enable | adc_interrupt_enable |
| Peripheral flag get | ip_flag_get | adc_flag_get |
| Peripheral flag clear | ip_flag_clear | adc_flag_clear |

4.2.3 Encoding rules

This section describes the encoding rules related to firmware function library.

Type of variables:

```
typedef int32_t INT32;
typedef int16_t INT16;
typedef int8_t INT8;
typedef uint32_t UINT32;
typedef uint16_t UINT16;
typedef uint8_t UINT8;

typedef int32_t s32;
typedef int16_t s16;
typedef int8_t s8;

typedef const int32_t sc32; /*!< read only */
typedef const int16_t sc16; /*!< read only */
typedef const int8_t sc8; /*!< read only */

typedef __IO int32_t vs32;
typedef __IO int16_t vs16;
typedef __IO int8_t vs8;

typedef __I int32_t vsc32; /*!< read only */
typedef __I int16_t vsc16; /*!< read only */
typedef __I int8_t vsc8; /*!< read only */

typedef uint32_t u32;
typedef uint16_t u16;
typedef uint8_t u8;

typedef const uint32_t uc32; /*!< read only */
typedef const uint16_t uc16; /*!< read only */
typedef const uint8_t uc8; /*!< read only */

typedef __IO uint32_t vu32;
typedef __IO uint16_t vu16;
typedef __IO uint8_t vu8;

typedef __I uint32_t vuc32; /*!< read only */
typedef __I uint16_t vuc16; /*!< read only */
typedef __I uint8_t vuc8; /*!< read only */
```

4.2.3.1 Flag type

```
typedef enum {RESET = 0, SET = !RESET} flag_status;
```

4.2.3.2 Function status type

```
typedef enum {FALSE = 0, TRUE = !FALSE} confirm_state;
```

4.2.3.3 Error status type

```
typedef enum {ERROR = 0, SUCCESS = !ERROR} error_status;
```

4.2.3.4 Peripheral type

① Peripherals

Define the base address of peripheral in the at32fxxx_ip.h, for example, in the at32f403a_407.h:

```
#define ADC1_BASE (APB2PERIPH_BASE + 0x2400)  
#define ADC2_BASE (APB2PERIPH_BASE + 0x2800)
```

Define the type of a peripheral in the at32fxxx_ip.h, for example, in the at32f403a_407_adc.h:

```
#define ADC1 ((adc_type *)ADC1_BASE)  
#define ADC2 ((adc_type *)ADC2_BASE)
```

② Peripheral registers and bits

Define the type of a peripheral in the at32fxxx_ip.h, for example, in the at32f403a_407_adc.h:

```
/**  
 * @brief type define adc register all  
 */  
  
typedef struct  
{  
  
    /**  
     * @brief adc sts register, offset:0x00  
     */  
    union  
    {  
        __IO uint32_t sts;  
        struct  
        {  
            __IO uint32_t vmor : 1; /* [0] */  
            __IO uint32_t cce : 1; /* [1] */  
            __IO uint32_t pcce : 1; /* [2] */  
            __IO uint32_t pccs : 1; /* [3] */  
            __IO uint32_t occs : 1; /* [4] */  
            __IO uint32_t reserved1 : 27; /* [31:5] */  
        } sts_bit;  
    };  
};  
...
```

```
...
...
/**  
 * @brief adc odt register, offset:0x4C  
 */  
union  
{  
    __IO uint32_t odt;  
    struct  
    {  
        __IO uint32_t odt          : 16; /* [15:0] */  
        __IO uint32_t adc2odt     : 16; /* [31:16] */  
    } odt_bit;  
};  
  
} adc_type;
```

③ Examples of peripheral register access

| | |
|------------------------------------|-----------------------------|
| Read peripheral | i = ADC1-> ctrl1; |
| Write peripheral | ADC1-> ctrl1 = i; |
| Read bit 5 in bit-field mode | i = ADC1-> ctrl1. cceien; |
| Write 1 to bit 5 in bit-field mode | ADC1-> ctrl1. cceien= TRUE; |
| Write 1 to bit 5 | ADC1-> ctrl1 = 1<<5; |
| Write 0 to bit 5 | ADC1-> ctrl1&= ~(1<<5) ; |

4.3 BSP structure

4.3.1 BSP folder structure

BSP (Board Support Package) structure is shown in Figure 27.

- ReleaseNotes_AT32F403A_407_Firmware_Library.pdf: document revision history

libraries

- **drivers**: driver library for peripherals
 - src folder: low-level driver source file for peripherals, such as at32fxxx_ip.c
 - inc folder: low-level driver header file for peripherals, such as at32fxxx_ip.h
- **cmsis**: core-related files
 - cm4 folder: core-related files, including cortex-m4 library, system initialization file, startup file, etc.
 - dsp folder: dsp-related files

middlewares

Third-party software or public protocols, including USB protocol layer driver, network protocol driver, operating system source code, etc.

project

examples: demo
templates: template project, including Keil4, keil5, IAR6, IAR7, IAR8 and eclipse_gcc

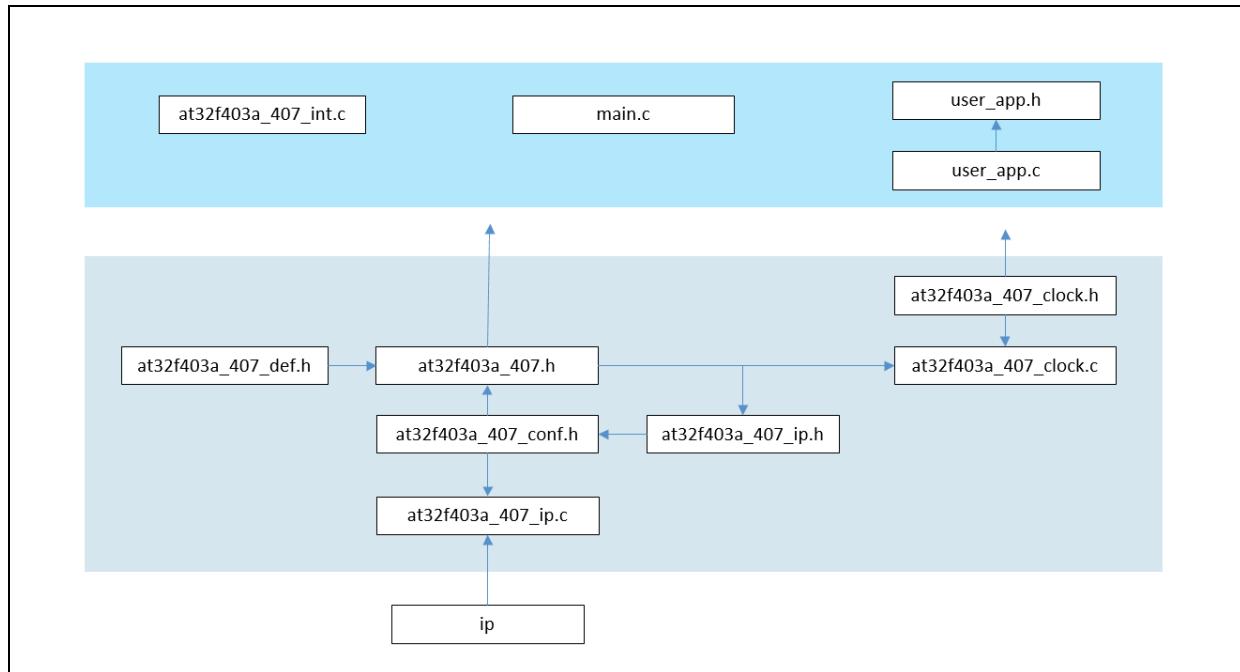

utilities

Store application cases

4.3.2 BSP function library structure

Figure 28 shows the architecture of BSP function library.

Figure 28. BSP function library structure

BSP function library files are described in Table 3.

Table 3. Summary of BSP function library files

| File name | Description |
|-------------------------|---|
| at32f403a_407_conf.h | Macro definition for peripheral enable, and external high-speed clock HEXT_VALUE |
| main.c | Main function |
| at32f403a_407_ip.c | Driver source file for a peripheral, for example,at32f403a_407_adc.c |
| at32f403a_407_ip.h | Driver header file for a peripheral, for example,at32f403a_407_adc.h |
| at32f403a_407.h | In the header file (at32f403a_407.h), the definition USE_STDPERIPH_DRIVER is used to determine whether the Keil RTE is used or not. Enabling the definition while Keil RTE is unused can prevent Keil-MDK from enabling _RTE_ accidentally. |
| at32f403a_407_clock.c | This is a clock configuration file used to configure default clock frequency and clock path. |
| at32f403a_407_clock.h | This is a clock configure header file. |
| at32f403a_407_int.c | This is a source file for interrupt functions that programs interrupt handling code. |
| at32f403a_407_int.h | This is a header file for interrupt functions. |
| at32f403a_407_misc.c | This is a source file for other configurations, such as, nvic configuration function, systick clock source selection. |
| at32f403a_407_misc.h | This is a header file for other configurations. |
| startup_at32f403a_407.s | This is a startup file. |

4.3.3 Initialization and configuration for peripherals

This section describes how to initialize and configure peripherals using GPIO as an example.

GPIO initialization

Step 1: Define the gpio_init_type, for example, gpio_init_type gpio_init_struct;

Step 2: Enable GPIO clock using the function crm_periph_clock_enable;

Step 3: De-initialize the structure gpio_init_struct to allow the values of other members (mostly default values) to be correctly written, for example, gpio_default_para_init(&gpio_init_struct);

Step 4: Configure member of the structure, and write structure parameters into GPIO registers through the gpio_init, for example,

```
gpio_init_struct.gpio_pins = GPIO_PINS_2 | GPIO_PINS_3;  
gpio_init_struct.gpio_mode = GPIO_MODE_OUTPUT;  
gpio_init_struct.gpio_out_type = GPIO_OUTPUT_PUSH_PULL;  
gpio_init_struct.gpio_pull = GPIO_PULL_NONE;  
gpio_init_struct.gpio_drive_strength = GPIO_DRIVE_STRENGTH_STRONGER;  
gpio_init(GPIOA, &gpio_init_struct);
```

For more information on peripheral initialization procedure, refer to the section of peripherals of the Reference Manual, and the section of peripherals of the

AT32Fxxx_Firmware_Library_V2.x.x.zip\project\at_start_fxxx\examples.

4.3.4 Peripheral functions format description

Table 4. Function format description for peripherals

| Name | Description |
|------------------------|---|
| Function name | The name of a peripheral function. |
| Function prototype | Prototype declaration |
| Function description | Brief description of how the function is executed |
| Input parameter n | Description of the input parameters |
| Output parameter n | Description of the output parameters |
| Return value | Value returned by the function |
| Required preconditions | Requirements before calling the function |
| Called functions | Other library functions called |

5 AT32F413 peripheral library functions

5.1 HICK automatic clock calibration (ACC)

The ACC register structure acc_type is defined in the "at32f413_acc.h".

```
/*
 * @brief type define acc register all
 */
typedef struct
{
    .....
} acc_type;
```

The table below gives a list of the ACC registers.

Table 5. Summary of ACC registers

| Register | Description |
|-----------|------------------------|
| acc_sts | ACC status register |
| acc_ctrl1 | ACC control register 1 |
| acc_ctrl2 | ACC control register 2 |
| acc_c1 | ACC compare value 1 |
| acc_c2 | ACC compare value 2 |
| acc_c3 | ACC compare value 3 |

The table below gives a list of the ACC library functions.

Table 6. Summary of ACC library functions

| Function name | Description |
|-----------------------------|---------------------------------------|
| acc_calibration_mode_enable | ACC calibration mode enable |
| acc_step_set | Configure ACC calibration step length |
| acc_interrupt_enable | ACC interrupt enable |
| acc_hicktrim_get | Get ACC trimming calibration value |
| acc_hickcal_get | Get ACC coarse calibration value |
| acc_write_c1 | Write ACC C1 register value |
| acc_write_c2 | Write ACC C2 register value |
| acc_write_c3 | Write ACC C3 register value |
| acc_read_c1 | Read ACC C1 register value |
| acc_read_c2 | Read ACC C2 register value |
| acc_read_c3 | Read ACC C3 register value |
| acc_flag_get | Get ACC interrupt flag |
| acc_flag_clear | Clear ACC interrupt flag |

5.1.1 acc_calibration_mode_enable function

The table below describes the function acc_calibration_mode_enable.

Table 7. acc_calibration_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | acc_calibration_mode_enable |
| Function prototype | void acc_calibration_mode_enable(uint16_t acc_trim, confirm_state new_state); |
| Function description | ACC calibration mode enable |
| Input parameter 1 | acc_trim: calibration mode selection ACC_CAL_HICKCAL or ACC_CAL_HICKTRIM |
| Input parameter 2 | new_state: Enable or disable ACC |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

acc_trim

Calibration mode selection

ACC_CAL_HICKCAL: Coarse calibration mode

ACC_CAL_HICKTRIM: Fine calibration mode

new_state

Enable or disable ACC

FALSE: Disabled

TRUE: Enabled

Example:

```
/* open acc calibration */
acc_calibration_mode_enable(ACC_CAL_HICKTRIM, TRUE);
```

5.1.2 acc_step_set function

The table below describes the function acc_step_set.

Table 8. acc_step_set function

| Name | Description |
|------------------------|--|
| Function name | acc_step_set |
| Function prototype | void acc_step_set(uint8_t step_value); |
| Function description | Configure ACC calibration step length |
| Input parameter 1 | step_value: step value for calibration |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

step_value

This 4-bit field defines the value to be changed for each calibration.

Note: To obtain better calibration accuracy, it is recommended to set the step value to 1.

When ENTRIM=0, only HICKCAL is calibrated. If the step value is incremented or decremented

by one, the corresponding HICKCAL follows the change rule (increased or decreased by one), and the HICK frequency will increase or decrease by 40 KHz (design value), meaning a positive correlation between them.

When ENTRIM=1, only the HICKTRIM is calibrated. If the step value is incremented or decremented by one, the corresponding HICKTRIM follows the change rule (increased or decreased by one), and the HICK will increase or decrease by 20 KHz (design value), meaning a positive correlation between them.

Example:

```
/* set acc step value */
acc_step_set(0x1);
```

5.1.3 acc_interrupt_enable function

The table below describes the function acc_interrupt_enable.

Table 9. acc_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | dma_interrupt_enable |
| Function prototype | void acc_interrupt_enable(uint16_t acc_int, confirm_state new_state); |
| Function description | Enable acc interrupts |
| Input parameter 1 | acc_int: interrupt source selection |
| Input parameter 2 | new_state: enable or disable interrupts |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

acc_int

Interrupt source selection

ACC_CALRDYIEN_INT: Calibration complete interrupt

ACC_EIEN_INT: Reference signal lost interrupt

new_state

Enable or disable interrupts

FALSE: Interrupt disabled

TRUE: Interrupt enabled

Example:

```
/* enable the acc reference signal lost interrupt */
acc_interrupt_enable(ACC_EIEN_INT, TRUE);
```

5.1.4 acc_hicktrim_get function

The table below describes the function acc_hicktrim_get.

Table 10. acc_hicktrim_get function

| Name | Description |
|------------------------|---------------------------------------|
| Function name | acc_hicktrim_get |
| Function prototype | uint8_t acc_hicktrim_get(void); |
| Function description | Get acc trimming calibration value |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return acc trimming calibration value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get trim value*/  
uint8_t trim_value;  
trim_value = acc_hicktrim_get();
```

5.1.5 acc_hickcal_get function

The table below describes the function acc_hickcal_get.

Table 11. acc_hickcal_get function

| Name | Description |
|------------------------|-------------------------------------|
| Function name | acc_hickcal_get |
| Function prototype | uint8_t acc_hickcal_get(void); |
| Function description | Get acc coarse calibration value |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return acc coarse calibration value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get cal value*/  
uint8_t cal_value;  
cal_value = acc_hickcal_get();
```

5.1.6 acc_write_c1 function

The table below describes the function acc_write_c1.

Table 12. acc_write_c1 function

| Name | Description |
|------------------------|--|
| Function name | acc_write_c1 |
| Function prototype | void acc_write_c1(uint16_t acc_c1_value); |
| Function description | Write ACC C1 register value |
| Input parameter | acc_c1_value: the value to be written in ACC C1 register |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* update the c1 value */  
acc_c2_value = 8000;  
acc_write_c1(acc_c2_value - 10);
```

5.1.7 acc_write_c2 function

The table below describes the function acc_write_c2.

Table 13. acc_write_c2 function

| Name | Description |
|------------------------|--|
| Function name | acc_write_c2 |
| Function prototype | void acc_write_c2(uint16_t acc_c2_value); |
| Function description | Write ACC C2 register value |
| Input parameter | acc_c2_value: the value to be written in ACC C2 register |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* update the c2 value */  
acc_c2_value = 8000;  
acc_write_c2(acc_c2_value - 10);
```

5.1.8 acc_write_c3 function

The table below describes the function acc_write_c3.

Table 14. acc_write_c3 function

| Name | Description |
|------------------------|--|
| Function name | acc_write_c3 |
| Function prototype | void acc_write_c3(uint16_t acc_c3_value); |
| Function description | Write ACC C3 register value |
| Input parameter | acc_c3_value: the value to be written in ACC C3 register |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* update the c3 value */  
acc_c2_value = 8000;  
acc_write_c3(acc_c2_value - 10);
```

5.1.9 acc_read_c1 function

The table below describes the function acc_read_c1.

Table 15. acc_read_c1 function

| Name | Description |
|------------------------|-----------------------------|
| Function name | acc_read_c1 |
| Function prototype | uint16_t acc_read_c1(void); |
| Function description | Read ACC C1 register value |
| Input parameter | NA |
| Output parameter | NA |
| Return value | ACC C1 register value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get the c1 value */  
uint16_t acc_c1_value;  
acc_c1_value = acc_read_c1();
```

5.1.10 acc_read_c2 function

The table below describes the function acc_read_c2.

Table 16. acc_read_c2 function

| Name | Description |
|------------------------|-----------------------------|
| Function name | acc_read_c2 |
| Function prototype | uint16_t acc_read_c2(void); |
| Function description | Read ACC C2 register value |
| Input parameter | NA |
| Output parameter | NA |
| Return value | ACC C2 register value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get the c2 value */  
uint16_t acc_c2_value;  
acc_c2_value = acc_read_c2();
```

5.1.11 acc_read_c3 function

The table below describes the function acc_read_c3.

Table 17. acc_read_c3 function

| Name | Description |
|------------------------|-----------------------------|
| Function name | acc_read_c3 |
| Function prototype | uint16_t acc_read_c3(void); |
| Function description | Read ACC C3 register value |
| Input parameter | NA |
| Output parameter | NA |
| Return value | ACC C3 register value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get the c3 value */  
uint16_t acc_c3_value;  
acc_c3_value = acc_read_c3();
```

5.1.12 acc_flag_get function

The table below describes the function acc_flag_get.

Table 18. acc_flag_get function

| Name | Description |
|------------------------|---|
| Function name | acc_flag_get |
| Function prototype | flag_status acc_flag_get(uint16_t acc_flag); |
| Function description | Get acc flag status |
| Input parameter 1 | acc_flag: ACC flag selection |
| Output parameter | NA |
| Return value | flag_status: indicates whether or not the flag has been set |
| Required preconditions | NA |
| Called functions | NA |

acc_flag

The acc_flag is used for flag selection, including:

ACC_RSLOST_FLAG: Reference signal lost interrupt

ACC_CALRDY_FLAG: Calibration complete interrupt

flag_status

RESET: Corresponding flag bit is not set

SET: Corresponding flag bit is set

Example:

```
if(acc_flag_get(ACC_CALRDY_FLAG) != RESET)
{
    at32_led_toggle(LED2);
    /* clear acc calibration ready flag */
    acc_flag_clear(ACC_CALRDY_FLAG);
}
```

5.1.13 acc_flag_clear function

The table below describes the function acc_flag_clear.

Table 19. acc_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | acc_flag_clear |
| Function prototype | void acc_flag_clear(uint16_t acc_flag); |
| Function description | Clear acc flag |
| Input parameter 1 | acc_flag: ACC flag selection |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

acc_flag

The acc_flag is used for flag selection, including:

ACC_RSLOST_FLAG: Reference signal lost interrupt

ACC_CALRDY_FLAG: Calibration complete interrupt

Example:

```
if(acc_flag_get(ACC_CALRDY_FLAG) != RESET)
{
    at32_led_toggle(LED2);
    /* clear acc calibration ready flag */
    acc_flag_clear(ACC_CALRDY_FLAG);
}
```

5.2 Analog-to-digital converter (ADC)

The ADC register structure adc_type is defined in the “at32f413_adc.h”.

```
/**  
 * @brief type define adc register all  
 */  
typedef struct  
{  
    .....  
} adc_type;
```

The table below gives a list of the ADC registers.

Table 20. Summary of ADC registers

| Register | Description |
|----------|--|
| sts | ADC status register |
| ctrl1 | ADC control register 1 |
| ctrl2 | ADC control register 2 |
| spt1 | ADC sample time register 1 |
| spt2 | ADC sample time register 2 |
| pcdto1 | ADC preempted channel data offset register 1 |
| pcdto2 | ADC preempted channel data offset register 2 |
| pcdto3 | ADC preempted channel data offset register 3 |
| pcdto4 | ADC preempted channel data offset register 4 |
| vmhb | ADC voltage monitor high boundary register |
| vmlb | ADC voltage monitor low boundary register |
| osq1 | ADC ordinary sequence register 1 |
| osq2 | ADC ordinary sequence register 2 |
| osq3 | ADC ordinary sequence register 3 |
| psq | ADC preempted sequence register |
| pdt1 | ADC preempted data register 1 |
| pdt2 | ADC preempted data register 2 |
| pdt3 | ADC preempted data register 3 |
| pdt4 | ADC preempted data register 4 |
| odt | ADC ordinary data register |

The table below gives a list of the ADC library functions.

Table 21. Summary of ADC library functions

| Function name | Description |
|---|---|
| adc_reset | Reset all ADC registers to their reset values |
| adc_enable | Enable A/D converter |
| adc_combine_mode_select | Select master/slave mode |
| adc_base_default_para_init | Define an initial value for adc_base_struct |
| adc_base_config | Configure ADC registers with the initialized parameters of the adc_base_struct |
| adc_dma_mode_enable | Enable DMA transfer for ordinary group |
| adc_interrupt_enable | Enable the selected ADC event interrupt |
| adc_calibration_init | Initialization calibration |
| adc_calibration_init_status_get | Get initialization calibration status |
| adc_calibration_start | Start calibration |
| adc_calibration_status_get | Get calibration status |
| adc_voltage_monitor_enable | Enable voltage monitoring for ordinary/preempted channels and a single channel |
| adc_voltage_monitor_threshold_value_set | Set the threshold of voltage monitoring |
| adc_voltage_monitor_single_channel_select | Select a single channel for voltage monitoring |
| adc_ordinary_channel_set | Configure ordinary channels, including channel selection, conversion sequence number and sampling time |
| adc_preempt_channel_length_set | Configure the length of preempted group conversion sequence |
| adc_preempt_channel_set | Configure preempted channels, including channel selection, conversion sequence number and sampling time |
| adc_ordinary_conversion_trigger_set | Enable trigger mode and trigger event selection for ordinary conversion |
| adc_preempt_conversion_trigger_set | Enable trigger mode and trigger event selection for preempted conversion |
| adc_preempt_offset_value_set | Set data offset for preempted conversion |
| adc_ordinary_part_count_set | Set the number of ordinary channels for each triggered conversion in partition mode |
| adc_ordinary_part_mode_enable | Enable partition mode for ordinary channels |
| adc_preempt_part_mode_enable | Enable partition mode for preempted channels |
| adc_preempt_auto_mode_enable | Enable auto conversion of preempted group at the end of ordinary conversion |
| adc_tempersensor_vintrv_enable | Enable internal temperature sensor and V _{INTRV} |
| adc_ordinary_software_trigger_enable | Software trigger ordinary group conversion |
| adc_ordinary_software_trigger_status_get | Get the status of ordinary group conversion triggered by software |
| adc_preempt_software_trigger_enable | Software trigger preempted group conversion |
| adc_preempt_software_trigger_status_get | Get the status of preempted group conversion triggered by software |
| adc_ordinary_conversion_data_get | Get data of ordinary group conversion in non-master-slave mode |
| adc_combine_ordinary_conversion_data_get | Get data of ordinary group conversion in master-slave mode |
| adc_preempt_conversion_data_get | Get the converted data of preempted group |
| adc_flag_get | Get the status of flag bits |
| adc_flag_clear | Clear Clear flag bits |

5.2.1 adc_reset function

The table below describes the function adc_reset.

Table 22. adc_reset function

| Name | Description |
|------------------------|---|
| Function name | adc_reset |
| Function prototype | void adc_reset(adc_type *adc_x) |
| Function description | Reset all ADC registers to their reset values |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset() |

Example:

```
/* deinitialize adc1 */
adc_reset(ADC1);
```

5.2.2 adc_enable function

The table below describes the function adc_enable.

Table 23. adc_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_enable |
| Function prototype | void adc_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Enable/disable A/D converter |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status of A/D converter This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable adc1 */
adc_enable(ADC1, TRUE);
```

Note: When the ADC is enabled, calling the function adc_enable triggers ordinary channel to start conversion.

5.2.3 adc_combine_mode_select function

The table below describes the function adc_combine_mode_select.

Table 24. adc_combine_mode_select function

| Name | Description |
|------------------------|---|
| Function name | adc_combine_mode_select |
| Function prototype | void adc_combine_mode_select(adc_combine_mode_type combine_mode) |
| Function description | Select ADC1 master/slave mode |
| Input parameter | combine_mode: indicates the master/slave mode supported by ADC1 This parameter can be any enumerated value in the adc_combine_mode_type. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

combine_mode

The combine_mode is used to select master/slave combined mode, including:

ADC_INDEPENDENT_MODE: Non-combined (independent) mode

ADC_ORDINARY_SMLT_PREEMPT_SMLT_MODE:

Ordinary simultaneous + preempted simultaneous

ADC_ORDINARY_SMLT_PREEMPT_INTERLTRIG_MODE:

Ordinary simultaneous + interleaved preempted

ADC_ORDINARY_SHORTSHIFT_PREEMPT_SMLT_MODE:

Preempted simultaneous + ordinary group short shift

ADC_ORDINARY_LONGSHIFT_PREEMPT_SMLT_MODE:

Preempted simultaneous + ordinary group long shift

ADC_PREEMPT_SMLT_ONLY_MODE: Preempted simultaneous

ADC_ORDINARY_SMLT_ONLY_MODE: Ordinary simultaneous

ADC_ORDINARY_SHORTSHIFT_ONLY_MODE: Ordinary group short shift

ADC_ORDINARY_LONGSHIFT_ONLY_MODE: Ordinary group long shift

ADC_PREEMPT_INTERLTRIG_ONLY_MODE: interleaved preempted group trigger

Example:

```
/* select combine mode as independent mode */
adc_combine_mode_select(ADC_INDEPENDENT_MODE);
```

Note: The adc_combine_mode_select function is used for ADC1 only and is invalid for ADC2.

5.2.4 adc_base_default_para_init function

The table below describes the function adc_base_default_para_init.

Table 25. adc_base_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | adc_base_default_para_init |
| Function prototype | void adc_base_default_para_init(adc_base_config_type *adc_base_struct) |
| Function description | Set the initial value for the adc_base_struct |
| Input parameter | adc_base_struct: adc_base_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The default values of members in the adc_base_struct:

| | |
|--------------------------|---------------------|
| sequence_mode: | FALSE |
| repeat_mode: | FALSE |
| data_align: | ADC_RIGHT_ALIGNMENT |
| ordinary_channel_length: | 1 |

Example:

```
/* initialize a adc_base_config_type structure */
adc_base_config_type adc_base_struct;
adc_base_default_para_init(&adc_base_struct);
```

5.2.5 adc_base_config function

The table below describes the function adc_base_config.

Table 26. adc_base_config function

| Name | Description |
|------------------------|---|
| Function name | adc_base_config |
| Function prototype | void adc_base_config(adc_type *adc_x, adc_base_config_type *adc_base_struct); |
| Function description | Initialize ADC registers with the specified parameters in the adc_base_struct |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_base_struct: adc_base_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_base_config_type structure

The adc_base_config_type is defined in the at32f413_adc.h.

typedef struct

```
{
    confirm_state      sequence_mode;
    confirm_state      repeat_mode;
```

```

    adc_data_align_type      data_align;
    uint8_t                  ordinary_channel_length;
} adc_base_config_type; the member parameters are described as follows:
sequence_mode
Set ADC sequence mode
FALSE: Select a single channel for conversion
TRUE: Select multiple channels for conversion
repeat_mode
Set ADC repeat mode
FALSE: When SQEN=0 , trigger a single channel conversion each time; when SQEN=1, trigger
       the conversion of a group of channels each time.
TRUE: When SQEN =0 repeatedly convert a single channel at each trigger; when SQEN=1,
       repeatedly convert a group of channels at each trigger until the ADCEN bit is cleared

```

data_align

Set data alignment of ADC

ADC_RIGHT_ALIGNMENT: right-aligned

ADC_LEFT_ALIGNMENT: left-aligned

ordinary_channel_length

Set the length of ordinary group ADC conversion

Example:

```

adc_base_config_type adc_base_struct;
adc_base_struct.sequence_mode = TRUE;
adc_base_struct.repeat_mode = FALSE;
adc_base_struct.data_align = ADC_RIGHT_ALIGNMENT;
adc_base_struct.ordinary_channel_length = 3;
adc_base_config(ADC1, &adc_base_struct);

```

5.2.6 adc_dma_mode_enable function

The table below describes the function adc_dma_mode_enable.

Table 27. adc_dma_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_dma_mode_enable |
| Function prototype | void adc_dma_mode_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Enable DMA transfer for ordinary group conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: DMA pre-configured status of ordinary group in DMA transfer mode This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable dma transfer adc ordinary conversion data */
```

```
adc_dma_mode_enable(ADC1, TRUE);
```

Note: The function `adc_dma_mode_enable` is used for ADC1 only and is invalid for ADC2.

5.2.7 adc_interrupt_enable function

The table below describes the function `adc_interrupt_enable`.

Table 28. adc_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | <code>adc_interrupt_enable</code> |
| Function prototype | <code>void adc_interrupt_enable(adc_type *adc_x, uint32_t adc_int, confirm_state new_state)</code> |
| Function description | Enable the selected ADC event interrupt |
| Input parameter 1 | <code>adc_x</code> : selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | <code>adc_int</code> : indicates the selected ADC This parameter is used to select any event interrupt supported by ADC. |
| Input parameter 3 | <code>new_state</code> : indicates the pre-configured status of ADC event interrupts This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_int

The `adc_int` is used to select and set event interrupts, with the following parameters:

`ADC_CCE_INT`: Interrupt enabled at the end of group conversion

`ADC_VMOR_INT`: Interrupt enabled when voltage monitor is outside the threshold

`ADC_PCCE_INT`: Interrupt enabled at the end of preempted group conversion

Example:

```
/* enable voltage monitoring out of range interrupt */
adc_interrupt_enable(ADC1, ADC_VMOR_INT, TRUE);
```

5.2.8 adc_calibration_init function

The table below describes the function `adc_calibration_init`.

Table 29. adc_calibration_init function

| Name | Description |
|------------------------|---|
| Function name | <code>adc_calibration_init</code> |
| Function prototype | <code>void adc_calibration_init(adc_type *adc_x)</code> |
| Function description | Initialization calibration |
| Input parameter | <code>adc_x</code> : selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* initialize A/D calibration */
adc_calibration_init(ADC1);
```

5.2.9 adc_calibration_init_status_get function

The table below describes the function adc_calibration_init_status_get.

Table 30. adc_calibration_init_status_get function

| Name | Description |
|------------------------|---|
| Function name | adc_calibration_init_status_get |
| Function prototype | flag_status adc_calibration_init_status_get(adc_type *adc_x) |
| Function description | Get the status of initialization calibration |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of calibration initialization Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait initialize A/D calibration success */
while(adc_calibration_init_status_get(ADC1));
```

5.2.10 adc_calibration_start function

The table below describes the function adc_calibration_start.

Table 31. adc_calibration_start function

| Name | Description |
|------------------------|---|
| Function name | adc_calibration_start |
| Function prototype | void adc_calibration_start(adc_type *adc_x) |
| Function description | Start calibration |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* start calibration process */
adc_calibration_start(ADC1);
```

5.2.11 adc_calibration_status_get function

The table below describes the function adc_calibration_status_get.

Table 32. adc_calibration_status_get function

| Name | Description |
|------------------------|--|
| Function name | adc_calibration_status_get |
| Function prototype | flag_status adc_calibration_status_get(adc_type *adc_x) |
| Function description | Get the status of calibration |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of calibration Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait calibration success */
while(adc_calibration_status_get(ADC1));
```

5.2.12 adc_voltage_monitor_enable function

The table below describes the function adc_voltage_monitor_enable.

Table 33. adc_voltage_monitor_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_voltage_monitor_enable |
| Function prototype | void adc_voltage_monitor_enable(adc_type *adc_x, adc_voltage_monitoring_type adc_voltage_monitoring) |
| Function description | Enable voltage monitor for ordinary/preempted group and a single channel |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_voltage_monitoring: select ordinary group, preempted group or a single channel for voltage monitoring This parameter can be any enumerated value in the adc_voltage_monitoring_type. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_voltage_monitoring

The adc_voltage_monitoring is used to select one or more channels of ordinary group/preempted group for voltage monitoring, including:

ADC_VMONITOR_SINGLE_ORDINARY:

Select a single ordinary channel for voltage monitoring

ADC_VMONITOR_SINGLE_PREEMPT:

Select a single preempted channel for voltage monitoring

ADC_VMONITOR_SINGLE_ORDINARY_PREEMPT:

Select a single channel from ordinary or preempted group for voltage monitoring

ADC_VMONITOR_ALL_ORDINARY:

Select all ordinary channels for voltage monitoring

ADC_VMONITOR_ALL_PREEMPT:

Select all preempted channels for voltage monitoring

ADC_VMONITOR_ALL_ORDINARY_PREEMPT:

Select all ordinary and preempted channels for voltage monitoring

ADC_VMONITOR_NONE:

No channels need voltage monitoring

Example:

```
/* enable the voltage monitoring on all ordinary and preempt channels */
adc_voltage_monitor_enable(ADC1, ADC_VMONITOR_ALL_ORDINARY_PREEMPT);
```

5.2.13 adc_voltage_monitor_threshold_value_set function

The table below describes the function adc_voltage_monitor_threshold_value_set.

Table 34. adc_voltage_monitor_threshold_value_set function

| Name | Description |
|------------------------|--|
| Function name | adc_voltage_monitor_threshold_value_set |
| Function prototype | void adc_voltage_monitor_threshold_value_set(adc_type *adc_x, uint16_t adc_high_threshold, uint16_t adc_low_threshold) |
| Function description | Configure the threshold of voltage monitoring |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_high_threshold: indicates the upper limit for voltage monitoring This parameter can be any value between 0x000~0xFFFF. |
| Input parameter 3 | adc_low_threshold: indicates the lower limit for voltage monitoring This parameter can be any value lower than that of adc_high_threshold in the range of 0x000~0xFFFF. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set voltage monitoring's high and low thresholds value */
adc_voltage_monitor_threshold_value_set(ADC1, 0xBBB, 0xAAA);
```

5.2.14 adc_voltage_monitor_single_channel_select function

The table below describes the function adc_voltage_monitor_single_channel_select.

Table 35. adc_voltage_monitor_single_channel_select function

| Name | Description |
|------------------------|--|
| Function name | adc_voltage_monitor_single_channel_select |
| Function prototype | void adc_voltage_monitor_single_channel_select(adc_type *adc_x, adc_channel_select_type adc_channel) |
| Function description | Select a single channel for voltage monitoring |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_channel: select a single channel for voltage monitoring Refer to adc_channel for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_channel

The adc_channel is used to select a single channel for voltage monitoring, including

ADC_CHANNEL_0: ADC channel 0

ADC_CHANNEL_1: ADC channel 1

.....

ADC_CHANNEL_16: ADC channel 16

ADC_CHANNEL_17: ADC channel 17

Example:

```
/* select the voltage monitoring's channel */
adc_voltage_monitor_single_channel_select(ADC1, ADC_CHANNEL_5);
```

5.2.15 adc_ordinary_channel_set function

The table below describes the function adc_ordinary_channel_set.

Table 36. adc_ordinary_channel_set function

| Name | Description |
|----------------------|--|
| Function name | adc_ordinary_channel_set |
| Function prototype | void adc_ordinary_channel_set(adc_type *adc_x, adc_channel_select_type adc_channel, uint8_t adc_sequence, adc_sampletime_select_type adc_sampletime) |
| Function description | Configure ordinary channels, including parameters such as channel selection, conversion sequence number and sampling time |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_channel: indicates the selected channel Refer to adc_channel for details. |
| Input parameter 3 | adc_sequence: defines the sequence of channel conversion This parameter can be any value from 1~16. |

| Name | Description |
|------------------------|---|
| Input parameter 4 | adc_sampletime: defines the sampling time for channel Refer to adc_sampletime for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_sampletime

The adc_sampletime is used to configure the sampling time of channels, including:

- ADC_SAMPLETIME_1_5: sampling time is 1.5 ADCCLK cycles
- ADC_SAMPLETIME_7_5: sampling time is 7.5 ADCCLK cycles
- ADC_SAMPLETIME_13_5: sampling time is 13.5 ADCCLK cycles
- ADC_SAMPLETIME_28_5: sampling time is 28.5 ADCCLK cycles
- ADC_SAMPLETIME_41_5: sampling time is 41.5 ADCCLK cycles
- ADC_SAMPLETIME_55_5: sampling time is 55.5 ADCCLK cycles
- ADC_SAMPLETIME_71_5: sampling time is 71.5 ADCCLK cycles
- ADC_SAMPLETIME_239_5: sampling time is 239.5 ADCCLK cycles

Example:

```
/* set ordinary channel's corresponding rank in the sequencer and sample time */
adc_ordinary_channel_set(ADC1, ADC_CHANNEL_4, 1, ADC_SAMPLETIME_239_5);
adc_ordinary_channel_set(ADC1, ADC_CHANNEL_5, 2, ADC_SAMPLETIME_239_5);
```

5.2.16 adc_preempt_channel_length_set function

The table below describes the function adc_preempt_channel_length_set.

Table 37. adc_preempt_channel_length_set function

| Name | Description |
|------------------------|---|
| Function name | adc_preempt_channel_length_set |
| Function prototype | void adc_preempt_channel_length_set(adc_type *adc_x, uint8_t adc_channel_length) |
| Function description | Set the length of preempted channel conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_channel_length: set the length of preempted channel conversion This parameter can be any value from 0x1~0x4. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set preempt channel length */
adc_preempt_channel_length_set(ADC1, 3);
```

5.2.17 adc_preempt_channel_set function

The table below describes the function adc_preempt_channel_set.

Table 38. adc_preempt_channel_set function

| Name | Description |
|------------------------|---|
| Function name | adc_preempt_channel_set |
| Function prototype | void adc_preempt_channel_set(adc_type *adc_x, adc_channel_select_type adc_channel, uint8_t adc_sequence, adc_sampletime_select_type adc_sampletime) |
| Function description | Configure preempted group, including parameters such as channel selection, conversion sequence number and sampling time |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_channel: indicates the selected channel Refer to adc_channel for details. |
| Input parameter 3 | adc_sequence: set the sequence number for channel conversion This parameter can be any value from 1~4. |
| Input parameter 4 | adc_sampletime: set the sampling time for channels Refer to adc_sampletime for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set ordinary channel's corresponding rank in the sequencer and sample time */
adc_preempt_channel_set(ADC1, ADC_CHANNEL_7, 1, ADC_SAMPLETIME_239_5);
adc_preempt_channel_set(ADC1, ADC_CHANNEL_8, 2, ADC_SAMPLETIME_239_5);
```

5.2.18 adc_ordinary_conversion_trigger_set function

The table below describes the function adc_ordinary_conversion_trigger_set.

Table 39. adc_ordinary_conversion_trigger_set function

| Name | Description |
|----------------------|---|
| Function name | adc_ordinary_conversion_trigger_set |
| Function prototype | void adc_ordinary_conversion_trigger_set(adc_type *adc_x, adc_ordinary_trig_select_type adc_ordinary_trig, confirm_state new_state) |
| Function description | Enable trigger mode and select trigger events for ordinary group conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_ordinary_trig: indicates the selected trigger event for ordinary group This parameter can be any enumerated value in the adc_ordinary_trig_select_type. |
| Input parameter 3 | new_state: indicates the pre-configured status of trigger mode This parameter can be TRUE or FALSE. |
| Output parameter | NA |

| Name | Description |
|------------------------|-------------|
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_ordinary_trig

The adc_ordinary_trig is used to select a trigger event for ordinary group conversion, including:

ADC1 &ADC2 trigger events

| | |
|---|----------------------------|
| ADC12_ORDINARY_TRIG_TMR1CH1: | TMR1 CH1 event |
| ADC12_ORDINARY_TRIG_TMR1CH2: | TMR1 CH2 event |
| ADC12_ORDINARY_TRIG_TMR1CH3: | TMR1 CH3 event |
| ADC12_ORDINARY_TRIG_TMR2CH2: | TMR2 CH2 event |
| ADC12_ORDINARY_TRIG_TMR3TRGOUT: | TMR3 TRGOUT event |
| ADC12_ORDINARY_TRIG_TMR4CH4: | TMR4 CH4 event |
| ADC12_ORDINARY_TRIG_EXINT11_TMR8TRGOUT: | EXINT 11/TMR8 TRGOUT event |
| ADC12_ORDINARY_TRIG_SOFTWARE: | Software trigger event |
| ADC12_ORDINARY_TRIG_TMR1TRGOUT: | TMR1 TRGOUT event |
| ADC12_ORDINARY_TRIG_TMR8CH1: | TMR8 CH1 event |
| ADC12_ORDINARY_TRIG_TMR8CH2: | TMR8 CH2 event |

Example:

```
/* set ordinary external trigger event */
adc_ordinary_conversion_trigger_set(ADC1, ADC12_ORDINARY_TRIG_TMR1CH1, TRUE);
```

5.2.19 adc_preempt_conversion_trigger_set function

The table below describes the function adc_preempt_conversion_trigger_set.

Table 40. adc_preempt_conversion_trigger_set function

| Name | Description |
|------------------------|--|
| Function name | adc_preempt_conversion_trigger_set |
| Function prototype | void adc_preempt_conversion_trigger_set(adc_type *adc_x, adc_preempt_trig_select_type adc_preempt_trig, confirm_state new_state) |
| Function description | Enable trigger mode and trigger events for preempted group conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_preempt_trig: selected trigger event for preempted group This parameter can be any enumerated value in the adc_preempt_trig_select_type. |
| Input parameter 3 | new_state: indicates the pre-configured status of trigger mode This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_preempt_trig

The adc_preempt_trig is used to select a trigger event for preempted group conversion, including:
ADC1 &ADC2 trigger events

| | |
|-------------------------------------|-------------------------|
| ADC12_PREEMPT_TRIG_TMR1TRGOUT: | TMR1 TRGOUT event |
| ADC12_PREEMPT_TRIG_TMR1CH4: | TMR1 CH4 event |
| ADC12_PREEMPT_TRIG_TMR2TRGOUT: | TMR2 TRGOUT event |
| ADC12_PREEMPT_TRIG_TMR2CH1: | TMR2 CH1 event |
| ADC12_PREEMPT_TRIG_TMR3CH4: | TMR3 CH4 event |
| ADC12_PREEMPT_TRIG_TMR4TRGOUT: | TMR4 TRGOUT event |
| ADC12_PREEMPT_TRIG_EXINT15_TMR8CH4: | EXINT 15/TMR8 CH4 event |
| ADC12_PREEMPT_TRIG_SOFTWARE: | Software trigger event |
| ADC12_PREEMPT_TRIG_TMR1CH1: | TMR1 CH1 event |
| ADC12_PREEMPT_TRIG_TMR8CH1: | TMR8 CH1 event |
| ADC12_PREEMPT_TRIG_TMR8TRGOUT: | TMR8 TRGOUT event |

Example:

```
/* set preempt external trigger event */
adc_preempt_conversion_trigger_set(ADC1, ADC12_PREEMPT_TRIG_SOFTWARE, TRUE);
```

5.2.20 adc_preempt_offset_value_set function

The table below describes the function adc_preempt_offset_value_set.

Table 41. adc_preempt_offset_value_set function

| Name | Description |
|------------------------|--|
| Function name | adc_preempt_offset_value_set |
| Function prototype | void adc_preempt_offset_value_set(adc_type *adc_x, adc_preempt_channel_type adc_preempt_channel, uint16_t adc_offset_value) |
| Function description | Set the offset value of preempted group conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_preempt_channel: indicates the selected channel Refer to adc_preempt_channel for details. |
| Input parameter 3 | adc_offset_value: set the offset value for the selected channel This parameter can be any value from 0x000~0xFFFF. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

adc_preempt_channel

The adc_preempt_channel is used to set an offset value for the selected channel, including

| | |
|------------------------|---------------------|
| ADC_PREEMPT_CHANNEL_1: | Preempted channel 1 |
| ADC_PREEMPT_CHANNEL_2: | Preempted channel 2 |
| ADC_PREEMPT_CHANNEL_3: | Preempted channel 3 |
| ADC_PREEMPT_CHANNEL_4: | Preempted channel 4 |

Example:

```
/* set preempt channel's conversion value offset */
adc_preempt_offset_value_set(ADC1, ADC_PREEMPT_CHANNEL_1, 0x111);
adc_preempt_offset_value_set(ADC1, ADC_PREEMPT_CHANNEL_2, 0x222);
adc_preempt_offset_value_set(ADC1, ADC_PREEMPT_CHANNEL_3, 0x333);
```

5.2.21 adc_ordinary_part_count_set function

The table below describes the function adc_ordinary_part_count_set.

Table 42. adc_ordinary_part_count_set function

| Name | Description |
|------------------------|--|
| Function name | adc_ordinary_part_count_set |
| Function prototype | void adc_ordinary_part_count_set(adc_type *adc_x, uint8_t adc_channel_count) |
| Function description | Set the number of ordinary channels at each triggered conversion in partition mode |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_channel_count: indicates the number of ordinary group in partition mode This parameter can be any value from 0x1~0x8. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set partitioned mode channel count */
adc_ordinary_part_count_set(ADC1, 2);
```

Note: In partition mode, only the number of ordinary group is configurable, and that of preempted group is fixed 1.

5.2.22 adc_ordinary_part_mode_enable function

The table below describes the function adc_ordinary_part_mode_enable.

Table 43. adc_ordinary_part_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | adc_ordinary_part_mode_enable |
| Function prototype | void adc_ordinary_part_mode_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Enable partition mode for ordinary channels |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status for partition mode of ordinary channels This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the partitioned mode on ordinary channel */
adc_ordinary_part_mode_enable(ADC1, TRUE);
```

5.2.23 adc_preempt_part_mode_enable function

The table below describes the function adc_preempt_part_mode_enable.

Table 44. adc_preempt_part_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_preempt_part_mode_enable |
| Function prototype | void adc_preempt_part_mode_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Enable partition mode for preempted channels |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status for partition mode of preempted channels This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the partitioned mode on preempt channel */
adc_preempt_part_mode_enable(ADC1, TRUE);
```

5.2.24 adc_preempt_auto_mode_enable function

The table below describes the function adc_preempt_auto_mode_enable.

Table 45. adc_preempt_auto_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | adc_preempt_auto_mode_enable |
| Function prototype | void adc_preempt_auto_mode_enable(adc_type *adc_x, confirm_state,new_state) |
| Function description | Enable auto preempted group conversion at the end of ordinary group conversion |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status for auto preempted group conversion This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable automatic preempt group conversion */
adc_preempt_auto_mode_enable(ADC1, TRUE);
```

5.2.25 adc_tempersensor_vinrv_enable function

The table below describes the function adc_tempersensor_vinrv_enable.

Table 46. adc_tempersensor_vinrv_enable function

| Name | Description |
|------------------------|--|
| Function name | adc_tempersensor_vinrv_enable |
| Function prototype | void adc_tempersensor_vinrv_enable(confirm_state new_state) |
| Function description | Enable internal temperature sensor and V _{INTRV} |
| Input parameter | new_state: indicates the pre-configured status or internal temperature sensor and V _{INTRV} This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the temperature sensor and vinrv channel */
adc_tempersensor_vinrv_enable(TRUE);
```

5.2.26 adc_ordinary_software_trigger_enable function

The table below describes the function adc_ordinary_software_trigger_enable.

Table 47. adc_ordinary_software_trigger_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_ordinary_software_trigger_enable |
| Function prototype | void adc_ordinary_software_trigger_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Trigger ordinary group conversion by software |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status for software-triggered ordinary group conversion This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable ordinary software start conversion */
adc_ordinary_software_trigger_enable(ADC1, TRUE);
```

5.2.27 adc_ordinary_software_trigger_status_get function

The table below describes the function adc_ordinary_software_trigger_status_get.

Table 48. adc_ordinary_software_trigger_status_get function

| Name | Description |
|------------------------|---|
| Function name | adc_ordinary_software_trigger_status_get |
| Function prototype | flag_status adc_ordinary_software_trigger_status_get(adc_type *adc_x) |
| Function description | Get the status of software-triggered ordinary group conversion |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of software-triggered ordinary group conversion Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait ordinary software start conversion */
while(adc_ordinary_software_trigger_status_get(ADC1));
```

5.2.28 adc_preempt_software_trigger_enable function

The table below describes the function adc_preempt_software_trigger_enable.

Table 49. adc_preempt_software_trigger_enable function

| Name | Description |
|------------------------|---|
| Function name | adc_preempt_software_trigger_enable |
| Function prototype | void adc_preempt_software_trigger_enable(adc_type *adc_x, confirm_state new_state) |
| Function description | Preempted group conversion triggered by software |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | new_state: indicates the pre-configured status of software-triggered preempted group conversion This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable preempt software start conversion */
adc_preempt_software_trigger_enable(ADC1, TRUE);
```

5.2.29 adc_preempt_software_trigger_status_get function

The table below describes the function adc_preempt_software_trigger_status_get.

Table 50. adc_preempt_software_trigger_status_get function

| Name | Description |
|------------------------|--|
| Function name | adc_preempt_software_trigger_status_get |
| Function prototype | flag_status adc_preempt_software_trigger_status_get(adc_type *adc_x) |
| Function description | Get the status of software-triggered preempted group conversion |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of software-triggered preempted group conversion Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait preempt software start conversion */
while(adc_preempt_software_trigger_status_get(ADC1));
```

5.2.30 adc_ordinary_conversion_data_get function

The table below describes the function adc_ordinary_conversion_data_get.

Table 51. adc_ordinary_conversion_data_get function

| Name | Description |
|------------------------|---|
| Function name | adc_ordinary_conversion_data_get |
| Function prototype | uint16_t adc_ordinary_conversion_data_get(adc_type *adc_x) |
| Function description | Get the converted data of ordinary group in non-master/slave mode |
| Input parameter | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Output parameter | NA |
| Return value | 16-bit converted data by ordinary group |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint16_t adc1_ordinary_index = 0;
adc1_ordinary_index = adc_ordinary_conversion_data_get(ADC1);
```

Note: This function can be used only when the ADC is in independent mode and each ADC is configured with a single channel.

5.2.31 adc_combine_ordinary_conversion_data_get function

The table below describes the function adc_combine_ordinary_conversion_data_get.

Table 52. adc_combine_ordinary_conversion_data_get function

| Name | Description |
|------------------------|---|
| Function name | adc_combine_ordinary_conversion_data_get |
| Function prototype | uint32_t adc_combine_ordinary_conversion_data_get(void) |
| Function description | Get the converted data of ordinary group in master/slave mode |
| Input parameter | NA |
| Output parameter | NA |
| Return value | 32-bit converted data by ordinary group (high 16 bits for ADC2 and low 16 bits for ADC1). |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t common_ordinary_index = 0;
common_ordinary_index = adc_combine_ordinary_conversion_data_get();
```

Note: This function is used only when ADC is in master/slave mode and each ADC is configured with a single channel.

5.2.32 adc_preempt_conversion_data_get function

The table below describes the function adc_preempt_conversion_data_get.

Table 53. adc_preempt_conversion_data_get function

| Name | Description |
|------------------------|--|
| Function name | adc_preempt_conversion_data_get |
| Function prototype | uint16_t adc_preempt_conversion_data_get(adc_type *adc_x, adc_preempt_channel_type adc_preempt_channel) |
| Function description | Get the converted data of preempted group |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_preempt_channel: indicates the selected preempted channel Refer to adc_preempt_channel for details. |
| Output parameter | NA |
| Return value | 16-bit converted data by preempted group |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint16_t adc1_preempt_valuetab[3] = {0};
adc1_preempt_valuetab[0] = adc_preempt_conversion_data_get(ADC1, ADC_PREEMPT_CHANNEL_1);
adc1_preempt_valuetab[1] = adc_preempt_conversion_data_get(ADC1, ADC_PREEMPT_CHANNEL_2);
adc1_preempt_valuetab[2] = adc_preempt_conversion_data_get(ADC1, ADC_PREEMPT_CHANNEL_3);
```

5.2.33 adc_flag_get function

The table below describes the function adc_flag_get.

Table 54. adc_flag_get function

| Name | Description |
|------------------------|--|
| Function name | adc_flag_get |
| Function prototype | flag_status adc_flag_get(adc_type *adc_x, uint8_t adc_flag) |
| Function description | Get the status of the flag bit |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_flag: indicates the selected flag. Refer to adc_flag for details. |
| Output parameter | NA |
| Return value | flag_status: the status for the selected flag bit Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

adc_flag

The adc_flag is used to select a flag to get its status, including

- ADC_VMOR_FLAG: Voltage monitor outside threshold
- ADC_CCE_FLAG: End of channel conversion
- ADC_PCCE_FLAG: End of preempted channel conversion
- ADC_PCCS_FLAG: Start of preempted channel conversion
- ADC_OCCS_FLAG: Start of ordinary channel conversion

Example:

```
/* check if wakeup preempted channelsconversion end flag is set */
if(adc_flag_get(ADC1, ADC_PCCE_FLAG) != RESET)
```

5.2.34 adc_interrupt_flag_get function

The table below describes the function adc_interrupt_flag_get.

Table 55. adc_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | adc_interrupt_flag_get |
| Function prototype | flag_status adc_interrupt_flag_get(adc_type *adc_x, uint8_t adc_flag) |
| Function description | Get the selected interrupt flag status |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_flag: indicates the selected flag. Refer to adc_flag for details. |
| Output parameter | NA |
| Return value | flag_status: the status for the selected flag bit Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

adc_flag

The adc_flag is used to select a flag to get its status, including

ADC_VMOR_FLAG: Voltage monitor outside threshold

ADC_CCE_FLAG: End of channel conversion

ADC_PCCE_FLAG: End of preempted channel conversion

Example

```
/* check if wakeup preempted channelsconversion end flag is set */  
if(adc_interrupt_flag_get(ADC1, ADC_PCCE_FLAG) != RESET)
```

5.2.35 adc_flag_clear function

The table below describes the function adc_flag_clear.

Table 56. adc_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | adc_flag_clear |
| Function prototype | void adc_flag_clear(adc_type *adc_x, uint32_t adc_flag) |
| Function description | Clear the flag bits that have been set |
| Input parameter 1 | adc_x: selected ADC peripheral This parameter can be ADC1 or ADC2. |
| Input parameter 2 | adc_flag: select a flag to be cleared Refer to adc_flag for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* preempted channelsconversion end flag clear */  
adc_flag_clear(ADC1, ADC_PCCE_FLAG);
```

5.3 Battery powered registers (BPR)

The BPR register structure bpr_type is defined in the “at32f413_bpr.h”.

```
/**  
 * @brief type define bpr register all  
 */  
  
typedef struct  
{  
  
} bpr_type;
```

The table below gives a list of the BPR registers.

Table 57. Summary of BPR registers

| Register | Description |
|----------|----------------------------------|
| dt1 | Battery powered data register 1 |
| dt2 | Battery powered data register 2 |
| dt3 | Battery powered data register 3 |
| dt4 | Battery powered data register 4 |
| dt5 | Battery powered data register 5 |
| dt6 | Battery powered data register 6 |
| dt7 | Battery powered data register 7 |
| dt8 | Battery powered data register 8 |
| dt9 | Battery powered data register 9 |
| dt10 | Battery powered data register 10 |
| rtccal | RTC calibration register |
| ctrl | BPR control register |
| ctrlsts | BPR control/status register |
| dt11 | Battery powered data register 11 |
| dt12 | Battery powered data register 12 |
| dt13 | Battery powered data register 13 |
| dt14 | Battery powered data register 14 |
| dt15 | Battery powered data register 15 |
| dt16 | Battery powered data register 16 |
| dt17 | Battery powered data register 17 |
| dt18 | Battery powered data register 18 |
| dt19 | Battery powered data register 19 |
| dt20 | Battery powered data register 20 |
| dt21 | Battery powered data register 21 |
| dt22 | Battery powered data register 22 |
| dt23 | Battery powered data register 23 |
| dt24 | Battery powered data register 24 |
| dt25 | Battery powered data register 25 |
| dt26 | Battery powered data register 26 |
| dt27 | Battery powered data register 27 |

| Register | Description |
|----------|----------------------------------|
| dt28 | Battery powered data register 28 |
| dt29 | Battery powered data register 29 |
| dt30 | Battery powered data register 30 |
| dt31 | Battery powered data register 31 |
| dt32 | Battery powered data register 32 |
| dt33 | Battery powered data register 33 |
| dt34 | Battery powered data register 34 |
| dt35 | Battery powered data register 35 |
| dt36 | Battery powered data register 36 |
| dt37 | Battery powered data register 37 |
| dt38 | Battery powered data register 38 |
| dt39 | Battery powered data register 39 |
| dt40 | Battery powered data register 40 |
| dt41 | Battery powered data register 41 |
| dt42 | Battery powered data register 42 |

The table below gives a list of the BPR library functions.

Table 58. Summary of BPR library functions

| Function name | Description |
|-------------------------------------|--|
| bpr_reset | Reset all battery powered data registers to their reset values |
| bpr_flag_get | Get the flag |
| bpr_flag_clear | Clear the flag |
| bpr_interrupt_enable | Enable tamper detection interrupt |
| bpr_data_read | Read data from battery powered data registers |
| bpr_data_write | Write data into battery powered data registers |
| bpr_RTC_output_select | Configure event output |
| bpr_RTC_clock_calibration_value_set | Configure clock calibration |
| bpr_tamper_pin_enable | Enable tamper detection |
| bpr_tamper_pin_active_level_set | Configure tamper detection active level |

5.3.1 bpr_reset function

The table below describes the function bpr_reset.

Table 59. bpr_reset function

| Name | Description |
|------------------------|--|
| Function name | bpr_reset |
| Function prototype | void bpr_reset(void); |
| Function description | Reset all battery powered data registers to their reset values |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | void crm_batteryPoweredDomainReset(confirm_state new_state); |

Example:

```
bpr_reset();
```

5.3.2 bpr_flag_get function

The table below describes the function bpr_flag_get.

Table 60. bpr_flag_get function

| Name | Description |
|------------------------|--|
| Function name | bpr_flag_get |
| Function prototype | flag_status bpr_flag_get(uint32_t flag); |
| Function description | Get the status of flag bit |
| Input parameter 1 | flag: flag selection Refer to the "flag" description below for details. |
| Output parameter | NA |
| Return value | flag_status: status of flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

This is used to select a flag and get its status, including

BPR_TAMPER_INTERRUPT_FLAG: Tamper detection interrupt

BPR_TAMPER_EVENT_FLAG: Tamper detection event

Example:

```
bpr_flag_get(BPR_TAMPER_INTERRUPT_FLAG);
```

5.3.3 bpr_interrupt_flag_get function

The table below describes the function bpr_interrupt_flag_get.

Table 61. bpr_interrupt_flag_get function

| Name | Description |
|------------------------|---|
| Function name | bpr_interrupt_flag_get |
| Function prototype | flag_status bpr_interrupt_flag_get(uint32_t flag); |
| Function description | Get the status of flag bit and judge the corresponding interrupt enable bit |
| Input parameter 1 | flag: flag selection Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | flag_status: status of flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

This is used to select a flag and get its status, including

BPR_TAMPER_INTERRUPT_FLAG: Tamper detection interrupt

BPR_TAMPER_EVENT_FLAG: Tamper detection event

Example

```
bpr_interrupt_flag_get(BPR_TAMPER_INTERRUPT_FLAG);
```

5.3.4 bpr_flag_clear function

The table below describes the function bpr_flag_clear.

Table 62. bpr_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | bpr_flag_clear |
| Function prototype | void bpr_flag_clear(uint32_t flag); |
| Function description | Clear the flag |
| Input parameter 1 | flag: the flag to be cleared Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

This is used to clear the selected flag, including:

BPR_TAMPER_INTERRUPT_FLAG: Tamper detection interrupt

BPR_TAMPER_EVENT_FLAG: Tamper detection event

Example:

```
bpr_flag_clear(BPR_TAMPER_INTERRUPT_FLAG);
```

5.3.5 bpr_interrupt_enable function

The table below describes the function bpr_interrupt_enable.

Table 63. bpr_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | bpr_interrupt_enable |
| Function prototype | void bpr_interrupt_enable(confirm_state new_state); |
| Function description | Enable tamper detection interrupt |
| Input parameter 1 | new_state: enable or disable tamper detection interrupt This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
bpr_interrupt_enable(TRUE);
```

5.3.6 bpr_data_read function

The table below describes the function bpr_data_read.

Table 64. bpr_data_read function

| Name | Description |
|------------------------|---|
| Function name | bpr_data_read |
| Function prototype | uint16_t bpr_data_read(bpr_data_type bpr_data); |
| Function description | Read data from battery powered data registers |
| Input parameter 1 | bpr_data: selected battery powered data registers Refer to the "bpr_data" description below for details. |
| Output parameter | NA |
| Return value | Return the data read from battery powered data register. |
| Required preconditions | NA |
| Called functions | NA |

bpr_data

This is used to select a data register.

BPR_DATA1: Battery powered data register 1

BPR_DATA2: Battery powered data register 2

BPR_DATA41: Battery powered data register 41

BPR_DATA42: Battery powered data register 42

Example:

```
bpr_data_read(BPR_DATA1);
```

5.3.7 bpr_data_write function

The table below describes the function bpr_data_write.

Table 65. bpr_data_write function

| Name | Description |
|------------------------|---|
| Function name | bpr_data_write |
| Function prototype | void bpr_data_write(bpr_data_type bpr_data, uint16_t data_value); |
| Function description | Write data into battery powered data registers |
| Input parameter 1 | bpr_data: selected battery powered data registers Refer to the “bpr_data” description below for details. |
| Input parameter 2 | data_value: 16-bit data |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

bpr_data

This is used to select a data register.

BPR_DATA1: Battery powered data register 1

BPR_DATA2: Battery powered data register 2

BPR_DATA41: Battery powered data register 41

BPR_DATA42: Battery powered data register 42

Example:

```
bpr_data_write(BPR_DATA1, 0x5A5A);
```

5.3.8 bpr_RTC_output_select function

The table below describes the function bpr_RTC_output_select.

Table 66. bpr_RTC_output_select function

| Name | Description |
|------------------------|--|
| Function name | bpr_RTC_output_select |
| Function prototype | void bpr_RTC_output_select(bpr_RTC_output_type output_source); |
| Function description | Configure event output |
| Input parameter 1 | output_source: output event Refer to the “output_source” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

output_source

This is used to select an output event.

BPR_RTC_OUTPUT_NONE: No output

BPR_RTC_OUTPUT_CLOCK_CAL_BEFORE:

Output the RTC clock with a frequency divided by 64 before calibration

BPR_RTC_OUTPUT_ALARM: Pulse output alarm event

| | |
|---------------------------------|---|
| BPR_RTC_OUTPUT_SECOND: | Pulse output second event |
| BPR_RTC_OUTPUT_CLOCK_CAL_AFTER: | Output the RTC clock with a frequency divided by 64 after calibration |
| BPR_RTC_OUTPUT_ALARM_TOGGLE: | Toggle output alarm event |
| BPR_RTC_OUTPUT_SECOND_TOGGLE: | Toggle output second event |

Example:

```
bpr_RTC_output_select(BPR_RTC_OUTPUT_ALARM);
```

5.3.9 bpr_RTC_clock_calibration_value_set function

The table below describes the function bpr_RTC_clock_calibration_value_set.

Table 67. bpr_RTC_clock_calibration_value_set function

| Name | Description |
|------------------------|--|
| Function name | bpr_RTC_clock_calibration_value_set |
| Function prototype | void bpr_RTC_clock_calibration_value_set(uint8_t calibration_value); |
| Function description | Configure clock calibration |
| Input parameter 1 | value: calibration value, range: 0~0x7F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
bpr_RTC_clock_calibration_value_set(0x7F);
```

5.3.10 bpr_tamper_pin_enable function

The table below describes the function bpr_tamper_pin_enable.

Table 68. bpr_tamper_pin_enable function

| Name | Description |
|------------------------|--|
| Function name | bpr_tamper_pin_enable |
| Function prototype | void bpr_tamper_pin_enable(confirm_state new_state); |
| Function description | Enable tamper detection |
| Input parameter 1 | new_state: enable or disable interrupt This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
bpr_tamper_pin_enable(TRUE);
```

5.3.11 bpr_tamper_pin_active_level_set function

The table below describes the function bpr_tamper_pin_active_level_set.

Table 69. bpr_tamper_pin_active_level_set function

| Name | Description |
|------------------------|---|
| Function name | bpr_tamper_pin_active_level_set |
| Function prototype | void bpr_tamper_pin_active_level_set(bpr_tamper_pin_active_level_type active_level); |
| Function description | Configure tamper detection active level |
| Input parameter 1 | active_level: tamper detection active level Refer to the “active_level” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

active_level

It is used to select the tamper detection active level.

BPR_TAMPER_PIN_ACTIVE_HIGH: Active high

BPR_TAMPER_PIN_ACTIVE_LOW: Active low

Example:

```
bpr_tamper_pin_active_level_set(BPR_TAMPER_PIN_ACTIVE_HIGH);
```

5.4 Controller area network (CAN)

The CAN register structure can_type is defined in the “at32f413_can.h”.

```
/*
 * @brief type define can register all
 */
typedef struct
{
    ...
} can_type;
```

The table below gives a list of the CAN registers.

Table 70. Summary of CAN registers

| Register | Description |
|----------|---|
| mctrl | CAN master control register |
| msts | CAN master status register |
| tsts | CAN transmit status register |
| rf0 | CAN receive FIFO 0 register |
| fr1 | CAN receive FIFO 1 register |
| inten | CAN interrupt enable register |
| ests | CAN error status register |
| btmg | CAN bit timing register |
| tmi0 | Transmit mailbox 0 identifier register |
| tmc0 | Transmit mailbox 0 data length and time stamp register |
| tmdtl0 | Transmit mailbox 0 data byte low register |
| tmdth0 | Transmit mailbox 0 data byte high register |
| tmi1 | Transmit mailbox 1 identifier register |
| tmc1 | Transmit mailbox 1 data length and time stamp register |
| tmdtl1 | Transmit mailbox 1 data byte low register |
| tmdth1 | Transmit mailbox 1 data byte high register |
| tmi2 | Transmit mailbox 2 identifier register |
| tmc2 | Transmit mailbox 2 data length and time stamp register |
| tmdtl2 | Transmit mailbox 2 data byte low register |
| tmdth2 | Transmit mailbox 2 data byte high register |
| rfi0 | Receive FIFO0 mailbox identifier register |
| rfc0 | Receive FIFO0 mailbox data length and time stamp register |
| rfdtl0 | Receive FIFO0 mailbox data byte low register |
| rfdth0 | Receive FIFO0 mailbox data byte high register |
| rfi1 | Receive FIFO1 mailbox identifier register |
| rfc1 | Receive FIFO1 mailbox data length and time stamp register |
| rfdtl1 | Receive FIFO1 mailbox data byte low register |
| rfdth1 | Receive FIFO1 mailbox data byte high register |
| fctrl | CAN filter control register |
| fmcfg | CAN filter mode configuration register |
| fscfg | CAN filter size configuration register |

| Register | Description |
|----------|---------------------------------------|
| frf | CAN filter FIFO assosication register |
| facfg | CAN filter activate control register |
| fb0f1 | CAN filter bank 0 filter register 1 |
| fb0f2 | CAN filter bank 0 filter register 2 |
| fb1f1 | CAN filter bank 1 filter register 1 |
| fb1f2 | CAN filter bank 1 filter register 2 |
| ... | ... |
| fb13f1 | CAN filter bank 13 filter register 1 |
| fb13f2 | CAN filter bank 13 filter register 2 |

The table below gives a list of the CAN library functions.

Table 71. Summary of CAN library functions

| Function name | Description |
|---------------------------------|--|
| can_reset | Reset all CAN registers to their reset values |
| can_baudrate_default_para_init | Configure the CAN baud rate initial structure with the initial value |
| can_baudrate_set | Configure CAN baud rate |
| can_default_para_init | Configure the CAN initial structure with the initial value |
| can_base_init | Initialize CAN registers with the specified parameters in the can_base_struct |
| can_filter_default_para_init | Configure the CAN filter initial structure with the initial value |
| can_filter_init | Initialize CAN registers with the specified parameters in the can_filter_init_struct |
| can_debug_transmission_prohibit | Select to disalbe/enable message reception and transmission when debug |
| can_ttc_mode_enable | Enable time-triggered mode |
| can_message_transmit | Transmit a frame of message |
| can_transmit_status_get | Get the status of transmission |
| can_transmit_cancel | Cancel transmission |
| can_message_receive | Receive a frame of message |
| can_receive_fifo_release | Release receive FIFO |
| can_receive_message_pending_get | Get the count of pending messages in FIFO |
| can_operating_mode_set | Configure CAN operating mode |
| can_doze_mode_enter | Enter sleep mode |
| can_doze_mode_exit | Exit sleep mode |
| can_error_type_record_get | Read CAN error type |
| can_receive_error_counter_get | Read CAN receive error counter |
| can_transmit_error_counter_get | Read CAN transmit error counter |
| can_interrupt_enable | Enable the selected CAN interrupt |
| can_flag_get | Read the selected CAN flag |
| can_flag_clear | Clear the selected CAN flag |

5.4.1 can_reset function

The table below describes the function can_reset.

Table 72. can_reset function

| Name | Description |
|------------------------|--|
| Function name | can_reset |
| Function prototype | void can_reset(can_type* can_x); |
| Function description | Reset CAN registers to their default values |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
can_reset(CAN1);
```

5.4.2 can_baudrate_default_para_init function

The table below describes the function can_baudrate_default_para_init.

Table 73. can_baudrate_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | can_baudrate_default_para_init |
| Function prototype | void can_baudrate_default_para_init(can_baudrate_type* can_baudrate_struct); |
| Function description | Configure the CAN baud rate initial structure with the initial value |
| Input parameter 1 | can_baudrate_struct: can_baudrate_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of can_baudrate_type before starting. |
| Called functions | NA |

Example:

```
can_baudrate_type can_baudrate_struct;  
can_baudrate_default_para_init(&can_baudrate_struct);
```

5.4.3 can_baudrate_set function

The table below describes the function can_baudrate_set.

Table 74. can_baudrate_set function

| Name | Description |
|------------------------|---|
| Function name | can_baudrate_set |
| Function prototype | error_status can_baudrate_set(can_type* can_x, can_baudrate_type* can_baudrate_struct); |
| Function description | Set CAN baud rate |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | can_baudrate_struct: can_baudrate_type pointer |
| Output parameter | NA |
| Return value | status_index: check if baud rate is configured successfully |
| Required preconditions | It is necessary to define a variable of can_baudrate_type before starting. |
| Called functions | NA |

The can_baudrate_type is defined in the at32f413_can.h.

typedef struct

```
{
    uint16_t      baudrate_div;
    can_rsaw_type rsaw_size;
    can_bts1_type bts1_size;
    can_bts2_type bts2_size;
} can_baudrate_type;
```

baudrate_div

CAN clock division factor

Value range: 0x001~0x400

rsaw_size

Defines the maximum of time unit that the CAN is allowed to lengthen or shorten in a bit

CAN_RSAW_1TQ: Resynchronization width is 1 time unit

CAN_RSAW_2TQ: Resynchronization width is 2 time units

CAN_RSAW_3TQ: Resynchronization width is 3 time units

CAN_RSAW_4TQ: Resynchronization width is 4 time units

bts1_size

segment1 time duration

bts1_size description

CAN_BTS1_1TQ: the bit time segment 1 has 1 time unit

.....

CAN_BTS1_16TQ: the bit time segment 1 has 16 time units

bts2_size

segment2 time duration

CAN_BTS2_1TQ: the bit time segment 2 has 1 time unit

.....

CAN_BTS2_8TQ: the bit time segment 2 has 8 time units

Example:

```

/* can baudrate, set baudrate = pclk/(baudrate_div *(1 + bts1_size + bts2_size)) */
can_baudrate_struct.baudrate_div = 10;
can_baudrate_struct.rsaw_size = CAN_RSAW_3TQ;
can_baudrate_struct.bts1_size = CAN_BTS1_8TQ;
can_baudrate_struct.bts2_size = CAN_BTS2_3TQ;
can_baudrate_set(CAN1, &can_baudrate_struct);

```

5.4.4 can_default_para_init function

The table below describes the function can_default_para_init.

Table 75. can_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | can_default_para_init |
| Function prototype | void can_default_para_init(can_base_type* can_base_struct); |
| Function description | Set an initial value for CAN initial structure |
| Input parameter 1 | can_base_struct: <i>can_base_type</i> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of can_base_type before starting. |
| Called functions | NA |

Example:

```

can_base_type can_base_struct;
can_default_para_init (&can_base_struct);

```

5.4.5 can_base_init function

The table below describes the function can_base_init.

Table 76. can_base_init function

| Name | Description |
|------------------------|---|
| Function name | can_base_init |
| Function prototype | error_status can_base_init(can_type* can_x, can_base_type* can_base_struct); |
| Function description | Initialize CAN registers with the specified parameters in the can_base_struct |
| Input parameter 1 | can_base_struct: <i>can_base_type</i> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of can_base_type before starting. |
| Called functions | NA |

The can_base_type is defined in the at32f413_can.h.

```

typedef struct
{
    can_mode_type          mode_selection;
    confirm_state           ttc_enable;
    confirm_state           aebo_enable;
}

```

```
confirm_state           aed_enable;
confirm_state           prsf_enable;
can_msg_discarding_rule_type mdrsel_selection;
can_msg_sending_rule_type mmssr_selection;
} can_base_type;

mode_selection
Test mode selection
CAN_MODE_COMMUNICATE:      Communication mode
CAN_MODE_LOOPBACK:         Loopback mode
CAN_MODE_LISTENONLY:        Listen only mode
CAN_MODE_LISTENONLY_LOOPBACK: Loopback + listen only mode

ttc_enable
Enable/disable time-triggered communication mode
FALSE: Disable time-triggered communication mode
TRUE:  Enable time-triggered communication mode (while receiving/sending messages, capture time stamp and store it into the CAN RFCx and CAN TMCx registers)

aebo_enable
Enable auto exit of bus-off mode
FALSE: Automatic exit of bus-off mode is disabled
TRUE:  Automatic exit of bus-off mode is enabled

aed_enable
Enable auto exit of sleep mode
FALSE: Auto exit of sleep mode is disabled
TRUE:  Auto exit of sleep mode is enabled

prsf_enable
Disable retransmission when transmit failed
FALSE: Retransmission is enabled
TRUE:  Retransmission is disabled

mdrsel_selection
Define message discard rule when reception overflows
CAN_DISCARDING_FIRST_RECEIVED: The previous message is discarded
CAN_DISCARDING_LAST_RECEIVED:  The new incoming message is discarded

mmssr_selection
Define multiple message transmit sequence rule
CAN_SENDING_BY_ID: The message with the smallest identifier number is first transmitted
CAN_SENDING_BY_REQUEST: The message with the first request order is first transmitted

Example:
/* can base init */
can_base_struct.mode_selection = CAN_MODE_COMMUNICATE;
can_base_struct.ttc_enable = FALSE;
can_base_struct.aebo_enable = TRUE;
can_base_struct.aed_enable = TRUE;
can_base_struct.prf_enable = FALSE;
can_base_struct.mdrsel_selection = CAN_DISCARDING_FIRST_RECEIVED;
can_base_struct.mmssr_selection = CAN_SENDING_BY_ID;
can_base_init(CAN1, &can_base_struct);
```

5.4.6 can_filter_default_para_init function

The table below describes the function can_filter_default_para_init.

Table 77. can_filter_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | can_filter_default_para_init |
| Function prototype | void can_filter_default_para_init(can_filter_init_type* can_filter_init_struct); |
| Function description | Configure CAN filter initialization structure with the initial value |
| Input parameter 1 | can_filter_init_struct: can_filter_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of can_filter_init_type before starting. |
| Called functions | NA |

Example:

```
can_filter_init_type can_filter_init_struct;
can_filter_default_para_init(&can_filter_init_struct);
```

5.4.7 can_filter_init function

The table below describes the function can_filter_init.

Table 78. can_filter_init function

| Name | Description |
|------------------------|--|
| Function name | can_filter_init |
| Function prototype | void can_filter_init(can_type* can_x, can_filter_init_type* can_filter_init_struct); |
| Function description | Initialize all CAN registers with the specified parameters in the can_base_struct |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | can_filter_init_struct: can_filter_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of can_filter_init_type before starting. |
| Called functions | NA |

The can_filter_init_type is defined in the at32f413_can.h.

typedef struct

```
{
    confirm_state          filter_activate_enable;
    can_filter_mode_type   filter_mode;
    can_filter_fifo_type   filter_fifo;
    uint8_t                 filter_number;
    can_filter_bit_width_type filter_bit;
    uint16_t                filter_id_high;
    uint16_t                filter_id_low;
    uint16_t                filter_mask_high;
```

```
    uint16_t          filter_mask_low;  
} can_filter_init_type;
```

filter_activate_enable

Enable/disable filter bank

FALSE: Disable filter bank

TRUE: Enable filter bank

filter_mode

Select filter mode

CAN_FILTER_MODE_ID_MASK: Identifier mask mode

CAN_FILTER_MODE_ID_LIST: Identifier list mode

filter_fifo

Select filter associated FIFO

CAN_FILTER_FIFO0: Associated with FIFO0

CAN_FILTER_FIFO1: Associated with FIFO1

filter_number

Select filter bank

Value range: 0~13

filter_bit

Select filter bit width

CAN_FILTER_16BIT: 16-bit

CAN_FILTER_32BIT: 32-bit

filter_id_high

The filter_id_high is used to configure the upper 16 bits of the filter identifier 1 (32-bit width, Mask/List mode), the filter identifier 2 (16-bit width, List mode) or the filter mask identifier 1 (16-bit width, Mask mode).

Value range: 0x0000~0xFFFF

filter_id_low

The filter_id_low is used to configure the lower 16 bits of the filter identifier 1 (32-bit width, Mask/List mode), or the filter identifier 1 (16-bit width, Mask/List mode)

Value range: 0x0000~0xFFFF

filter_mask_high

The filter_mask_high is used to configure the upper 16 bits of the filter identifier 1 (32-bit width, Mask mode), the filter mask identifier 2 (16-bit width, Mask mode), the upper 16 bits of the filter mask identifier 2 (32-bit width, List mode), or the filter mask identifier 4 (16-bit width, List mode).

Value range: 0x0000~0xFFFF

filter_mask_low

The filter_mask_low is used to configure the lower 16 bits of the filter identifier 1 (32-bit width, Mask mode), the filter mask identifier 2 (16-bit width, Mask mode), the lower 16 bits of the filter identifier 2 (32-bit width, List mode), or the filter mask identifier 4 (16-bit width, List mode).

Value range: 0x0000~0xFFFF

Example:

```
/* can filter init */  
can_filter_init_struct.filter_activate_enable = TRUE;  
can_filter_init_struct.filter_mode = CAN_FILTER_MODE_ID_MASK;  
can_filter_init_struct.filter_fifo = CAN_FILTER_FIFO0;  
can_filter_init_struct.filter_number = 0;
```

```

can_filter_init_struct.filter_bit = CAN_FILTER_32BIT;
can_filter_init_struct.filter_id_high = 0;
can_filter_init_struct.filter_id_low = 0;
can_filter_init_struct.filter_mask_high = 0;
can_filter_init_struct.filter_mask_low = 0;
can_filter_init(CAN1, &can_filter_init_struct);

```

5.4.8 can_debug_transmission_prohibit function

The table below describes the function can_debug_transmission_prohibit.

Table 79. can_debug_transmission_prohibit function

| Name | Description |
|------------------------|---|
| Function name | can_debug_transmission_prohibit |
| Function prototype | void can_debug_transmission_prohibit(can_type* can_x, confirm_state new_state); |
| Function description | Disable/enable message transceiver when debugging |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | new_state: Enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

/* prohibit can trans when debug*/
can_debug_transmission_prohibit(CAN1, TRUE);

```

5.4.9 can_ttc_mode_enable function

The table below describes the function can_ttc_mode_enable.

Table 80. can_ttc_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | can_ttc_mode_enable |
| Function prototype | void can_ttc_mode_enable(can_type* can_x, confirm_state new_state); |
| Function description | Enable time-triggered mode |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | new_state: Enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* can time trigger operation communication mode enable*/
can_ttc_mode_enable (CAN1, TRUE);
```

Note: When the ttc_enable is enabled in the can_base_init, it indicates that only the time stamp is enabled (during message receive and transmit, the time stamp is captured and stored in the CAN_RFCx and CAN_TMCx registers). But when the can_ttc_mode_enable is enabled, not only the time stamp is enable, but the time stamp transmission feature is enabled (during message transmission, the time stamp is sent on the 7th and 8th data byte).

5.4.10 can_message_transmit function

The table below describes the function can_message_transmit.

Table 81. can_message_transmit function

| Name | Description |
|------------------------|---|
| Function name | can_message_transmit |
| Function prototype | uint8_t can_message_transmit(can_type* can_x, can_tx_message_type* tx_message_struct); |
| Function description | Transmit a frame of message. |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | tx_message_struct: message pending for transmission, refer to can_tx_message_type |
| Output parameter | NA |
| Return value | transmit_mailbox: indicates the mailbox number required to send message |
| Required preconditions | Write the to-be-sent message in the tx_message_struct |
| Called functions | NA |

The can_tx_message_type is defined in the at32f413_can.h.

typedef struct

```
{
    uint32_t          standard_id;
    uint32_t          extended_id;
    can_identifier_type id_type;
    can_trans_frame_type frame_type;
    uint8_t            dlc;
    uint8_t            data[8];
}
```

} can_tx_message_type;

standard_id

Standard identifier (11 bits active)

Value range: 0x000~0x7FF

extended_id

Extended identifier (29 bits active)

Value range: 0x000~0x1FFFFFF

id_type

Identifier type

CAN_ID_STANDARD: Standard identifier

CAN_ID_EXTENDED: Extended identifier

frame_type

Frame type

CAN_TFT_DATA: Data frame

CAN_TFT_REMOTE: Remote frame

dlc

Data length (in byte)

Value range: 0~8

data[8]

Data pending for transmission

Value range: 0x00~0xFF

Example:

```
/* can transmit data */

static void can_transmit_data(void)
{
    uint8_t transmit_mailbox;
    can_tx_message_type tx_message_struct;
    tx_message_struct.standard_id = 0x400;
    tx_message_struct.extended_id = 0;
    tx_message_struct.id_type = CAN_ID_STANDARD;
    tx_message_struct.frame_type = CAN_TFT_DATA;
    tx_message_struct.dlc = 8;
    tx_message_struct.data[0] = 0x11;
    tx_message_struct.data[1] = 0x22;
    tx_message_struct.data[2] = 0x33;
    tx_message_struct.data[3] = 0x44;
    tx_message_struct.data[4] = 0x55;
    tx_message_struct.data[5] = 0x66;
    tx_message_struct.data[6] = 0x77;
    tx_message_struct.data[7] = 0x88;

    transmit_mailbox = can_message_transmit(CAN1, &tx_message_struct);
    while(can_transmit_status_get(CAN1, (can_tx_mailbox_num_type)transmit_mailbox) != CAN_TX_STATUS_SUCCESSFUL);
}
```

5.4.11 can_transmit_status_get function

The table below describes the function can_transmit_status_get.

Table 82. can_transmit_status_get function

| Name | Description |
|------------------------|--|
| Function name | can_transmit_status_get |
| Function prototype | can_transmit_status_type can_transmit_status_get(can_type* can_x, can_tx_mailbox_num_type transmit_mailbox); |
| Function description | Get the status of transmission |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | transmit_mailbox: indicates the mailbox number required to send message |
| Output parameter | NA |
| Return value | state_index: transmission status |
| Required preconditions | First send a frame of message and get a transmit mailbox number |
| Called functions | NA |

Example:

```
/* can transmit data */
static void can_transmit_data(void)
{
    uint8_t transmit_mailbox;
    can_tx_message_type tx_message_struct;
    tx_message_struct.standard_id = 0x400;
    tx_message_struct.extended_id = 0;
    tx_message_struct.id_type = CAN_ID_STANDARD;
    tx_message_struct.frame_type = CAN_TFT_DATA;
    tx_message_struct.dlc = 8;
    tx_message_struct.data[0] = 0x11;
    tx_message_struct.data[1] = 0x22;
    tx_message_struct.data[2] = 0x33;
    tx_message_struct.data[3] = 0x44;
    tx_message_struct.data[4] = 0x55;
    tx_message_struct.data[5] = 0x66;
    tx_message_struct.data[6] = 0x77;
    tx_message_struct.data[7] = 0x88;
    transmit_mailbox = can_message_transmit(CAN1, &tx_message_struct);
    while(can_transmit_status_get(CAN1, (can_tx_mailbox_num_type)transmit_mailbox) != CAN_TX_STATUS_SUCCESSFUL);
}
```

5.4.12 can_transmit_cancel function

The table below describes the function can_transmit_cancel.

Table 83. can_transmit_cancel function

| Name | Description |
|------------------------|--|
| Function name | can_transmit_cancel |
| Function prototype | void can_transmit_cancel(can_type* can_x, can_tx_mailbox_num_type transmit_mailbox); |
| Function description | Cancel transmission |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | transmit_mailbox: indicates the mailbox number required to send message |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | First send a frame of message and get a transmit mailbox number |
| Called functions | NA |

Example:

```
/* cancel a transmit request */
uint8_t transmit_mailbox;
transmit_mailbox = can_message_transmit(CAN1, &tx_message_struct);
can_transmit_cancel(CAN1, (can_tx_mailbox_num_type)transmit_mailbox);
```

5.4.13 can_message_receive function

The table below describes the function can_message_receive.

Table 84. can_message_receive function

| Name | Description |
|------------------------|--|
| Function name | can_message_receive |
| Function prototype | void can_message_receive(can_type* can_x, can_rx_fifo_num_type fifo_number, can_rx_message_type* rx_message_struct); |
| Function description | Receive a frame of message |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | fifo_number: receive FIFO This parameter can be CAN_RX_FIFO0 or CAN_RX_FIFO1. |
| Output parameter | rx_message_struct: indicates the received message, refer to can_rx_message_type |
| Return value | NA |
| Required preconditions | Receive FIFO not empty (FIFO message count is not zero) |
| Called functions | void can_receive_fifo_release(can_type* can_x, can_rx_fifo_num_type fifo_number); |

The can_rx_message_type is defined in the at32f413_can.h.

typedef struct

```
{
    uint32_t standard_id;
    uint32_t extended_id;
```

```
can_identifier_type    id_type;
can_trans_frame_type  frame_type;
uint8_t                dlc;
uint8_t                data[8];
uint8_t                filter_index;

} can_rx_message_type;
```

standard_id

Standard identifier (11 bits active)

Value range: 0x000~0x7FF

extended_id

Extended identifier (29 bits active)

Value range: 0x000~0x1FFFFFFF

id_type

Identifier type

CAN_ID_STANDARD: Standard identifier

CAN_ID_EXTENDED: Extended identifier

frame_type

Frame type

CAN_TFT_DATA: Data frame

CAN_TFT_REMOTE: Remote frame

dlc

Data length (in byte)

Value range: 0~8

data[8]

Data pending for transmission

Value range: 0x00~0xFF

filter_index

Filter match index (indicating the filter number that a message has passed through)

Value range: 0x00~0xFF

Example:

```
/* can receive message */
can_rx_message_type rx_message_struct;
can_message_receive(CAN1, CAN_RX_FIFO0, &rx_message_struct);
```

5.4.14 can_receive_fifo_release function

The table below describes the function can_receive_fifo_release.

Table 85. can_receive_fifo_release function

| Name | Description |
|------------------------|---|
| Function name | can_receive_fifo_release |
| Function prototype | void can_receive_fifo_release(can_type* can_x, can_rx_fifo_num_type fifo_number); |
| Function description | Release receive FIFO |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | fifo_number: receive FIFO This parameter can be CAN_RX_FIFO0 or CAN_RX_FIFO1. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | Message in FIFO has already been read |
| Called functions | NA |

Example:

```
/* can receive message */
void can_message_receive(can_type* can_x, can_rx_fifo_num_type fifo_number, can_rx_message_type*
rx_message_struct)
{
    /* get the id type */
    rx_message_struct->id_type = (can_identifier_type)can_x->fifo_mailbox[fifo_number].rfi_bit.rfidi;
    ...

    /* get the data field */
    rx_message_struct->data[0] = can_x->fifo_mailbox[fifo_number].rfdtl_bit.rfdt0;
    ...
    rx_message_struct->data[7] = can_x->fifo_mailbox[fifo_number].rfdth_bit.rfdt7;

    /* FIFO must be read before releasing FIFO */
    /* release the fifo */
    can_receive_fifo_release(can_x, fifo_number);
}
```

5.4.15 can_receive_message_pending_get function

The table below describes the function can_receive_message_pending_get.

Table 86. can_receive_message_pending_get function

| Name | Description |
|------------------------|---|
| Function name | can_receive_message_pending_get |
| Function prototype | uint8_t can_receive_message_pending_get(can_type* can_x, can_rx_fifo_num_type fifo_number); |
| Function description | Get the number of message pending for read in FIFO |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | fifo_number: receive FIFO This parameter can be CAN_RX_FIFO0 or CAN_RX_FIFO1. |
| Output parameter | NA |
| Return value | message_pending: the count of message pending for read in FIFO |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* return the number of pending messages of */
can_receive_message_pending_get (CAN1, CAN_RX_FIFO0);
```

5.4.16 can_operating_mode_set function

The table below describes the function can_operating_mode_set.

Table 87. can_operating_mode_set function

| Name | Description |
|------------------------|---|
| Function name | can_operating_mode_set |
| Function prototype | error_status can_operating_mode_set(can_type* can_x, can_operating_mode_type can_operating_mode); |
| Function description | Configure CAN operating modes |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | <i>can_operating_mode</i> : CAN operating mode selection |
| Output parameter | NA |
| Return value | status: indicates whether configuration is successful or not |
| Required preconditions | NA |
| Called functions | NA |

can_operating_mode

CAN_OPERATINGMODE_FREEZE: Freeze mode—for CAN controller initialization

CAN_OPERATINGMODE_DOZE: Sleep mode—CAN clock stopped to save power consumption

CAN_OPERATINGMODE_COMMUNICATE: Communication mode—for communication

Example:

```
/* set the operation mode —enter freeze mode*/
```

```

can_operating_mode_set (CAN1, CAN_OPERATINGMODE_FREEZE);

/* Initialize CAN controller */
...

/* set the operation mode -enter communicate mode*/
can_operating_mode_set (CAN1, CAN_OPERATINGMODE_COMMUNICATE);

/* Start communication: send and receive message */
...

```

5.4.17 can_doze_mode_enter function

The table below describes the function can_doze_mode_enter.

Table 88. can_doze_mode_enter function

| Name | Description |
|------------------------|---|
| Function name | can_doze_mode_enter |
| Function prototype | can_enter_doze_status_type can_doze_mode_enter(can_type* can_x); |
| Function description | Enter sleep mode |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | can_enter_doze_status : indicates whether the Sleep mode is entered |
| Required preconditions | NA |
| Called functions | NA |

can_enter_doze_status

Indicates whether the Sleep mode is entered or not

CAN_ENTER_DOZE_FAILED: Sleep mode entry failure

CAN_ENTER_DOZE_SUCCESSFUL: Sleep mode entry success

Example:

```

/* can enter the low power mode */

can_enter_doze_status_type can_enter_doze_status;
can_enter_doze_status = can_doze_mode_enter(CAN1);

```

5.4.18 can_doze_mode_exit function

The table below describes the function can_doze_mode_exit.

Table 89. can_doze_mode_exit function

| Name | Description |
|------------------------|---|
| Function name | can_doze_mode_exit |
| Function prototype | can_quit_doze_status_type can_doze_mode_exit(can_type* can_x); |
| Function description | Exit Sleep mode |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | can_quit_doze_status : indicates whether the Sleep mode has been left |
| Required preconditions | NA |
| Called functions | NA |

can_quit_doze_status

Indicates whether the Sleep mode has been left successfully

CAN_QUIT_DOZE_FAILED: Sleep mode exit failure

CAN_QUIT_DOZE_SUCCESSFUL: Sleep mode exit success

Example:

```
/* can exit the low power mode */
can_quit_doze_status_type can_quit_doze_status;
can_quit_doze_status = can_doze_mode_exit (CAN1);
```

5.4.19 can_error_type_record_get function

The table below describes the function can_error_type_record_get.

Table 90. can_error_type_record_get function

| Name | Description |
|------------------------|--|
| Function name | can_error_type_record_get |
| Function prototype | can_error_record_type can_error_type_record_get(can_type* can_x); |
| Function description | Read CAN error type |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | can_error_record : error type |
| Required preconditions | NA |
| Called functions | NA |

can_error_record

CAN error record

CAN_ERRORRECORD_NOERR: No error

CAN_ERRORRECORD_STUFFERR: Bit stuffing error

CAN_ERRORRECORD_FORMERR: Format error

CAN_ERRORRECORD_ACKERR: Acknowledge error

| | |
|----------------------------------|---------------------|
| CAN_ERRORRECORD_BITRECESSIVEERR: | Recessive bit error |
| CAN_ERRORRECORD_BITDOMINANTERR: | Dominant bit error |
| CAN_ERRORRECORD_CRCERR: | CRC error |
| CAN_ERRORRECORD_SOFTWARESETERR: | Set by software |

Example:

```
/* get the error type record (etr) */
can_error_record_type can_error_record;
can_error_record = can_error_type_record_get (CAN1);
```

5.4.20 can_receive_error_counter_get function

The table below describes the function can_receive_error_counter_get.

Table 91. can_receive_error_counter_get function

| Name | Description |
|------------------------|--|
| Function name | can_receive_error_counter_get |
| Function prototype | uint8_t can_receive_error_counter_get(can_type* can_x); |
| Function description | Read CAN receive error counter |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | receive_error_counter: Receive error counter Value range: 0x00~0xFF |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get the receive error counter (rec) */
uint8_t receive_error_counter;
receive_error_counter = can_receive_error_counter_get (CAN1);
```

5.4.21 can_transmit_error_counter_get function

The table below describes the function can_transmit_error_counter_get.

Table 92. can_transmit_error_counter_get function

| Name | Description |
|------------------------|--|
| Function name | can_transmit_error_counter_get |
| Function prototype | uint8_t can_transmit_error_counter_get(can_type* can_x); |
| Function description | Read CAN transmit error counter |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Output parameter | NA |
| Return value | transmit_error_counter: Transmit error counter Value range: 0x00~0xFF |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get the transmit error counter (tec) */
uint8_t transmit_error_counter;
transmit_error_counter = can_transmit_error_counter_get (CAN1);
```

5.4.22 can_interrupt_enable function

The table below describes the function can_interrupt_enable.

Table 93. can_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | can_interrupt_enable |
| Function prototype | void can_interrupt_enable(can_type* can_x, uint32_t can_int, confirm_state new_state); |
| Function description | Enable the selected CAN interrupt |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | <i>can_int</i> : Select CAN interrupts |
| Input parameter 3 | new_state: Enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

can_int

CAN interrupt selection

| | |
|------------------|---|
| CAN_TCIEN_INT: | Transmit mailbox empty interrupt enable |
| CAN_RF0MIEN_INT: | FIFO 0 receive message interrupt enable |
| CAN_RF0FIEN_INT: | Receive FIFO0 full interrupt enable |
| CAN_RF0OIEN_INT: | Receive FIFO0 overflow interrupt enable |
| CAN_RF1MIEN_INT: | FIFO1 receive message interrupt enable |
| CAN_RF1FIEN_INT: | Receive FIFO1 full interrupt enable |
| CAN_RF1OIEN_INT: | Receive FIFO1 overflow interrupt enable |
| CAN_EAIEN_INT: | Error active interrupt enable |
| CAN_EPIEN_INT: | Error passive interrupt enable |
| CAN_BOIEN_INT: | Bus-off interrupt enable |
| CAN_ETRIEN_INT: | Error type record interrupt enable |
| CAN_EOIEN_INT: | Error occur interrupt enable |
| CAN_QDZIEN_INT: | Quit Sleep mode interrupt enable |
| CAN_EDZIEN_INT: | Enter Sleep mode interrupt enable |

Example:

```
/* can interrupt config */
nvic_irq_enable(CAN1_SE IRQn, 0x00, 0x00);/*CAN1 error/status change interrupt */
```

```

nvic_irq_enable(USBFS_L_CAN1_RX0_IRQn, 0x00, 0x00);/*CAN1 FIFO0 receive interrupt */

/* FIFO 0 receive message interrupt enable */
can_interrupt_enable(CAN1, CAN_RF0MIEN_INT, TRUE);
/* error type record interrupt enable */
can_interrupt_enable(CAN1, CAN_ETRIEN_INT, TRUE);

/*This parameter is an error interrupt controller and it is enabled before error-related interrupts */
can_interrupt_enable(CAN1, CAN_EOien_INT, TRUE);

```

5.4.23 can_flag_get function

The table below describes the function can_flag_get.

Table 94. can_flag_get function

| Name | Description |
|------------------------|---|
| Function name | can_flag_get |
| Function prototype | flag_status can_flag_get(can_type* can_x, uint32_t can_flag); |
| Function description | Get the status of the selected CAN flag |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | <i>can_flag</i> : indicates the selected flag Refer to the “can_flag” description below for details. |
| Output parameter | NA |
| Return value | flag_status: the status of the selected flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

can_flag

This is used to select a flag and get its status, including

- CAN_EAF_FLAG: Error active flag
- CAN_EPFI_FLAG: Error passive flag
- CAN_BOFF_FLAG: Bus-off flag
- CAN_ETR_FLAG: Error type record (non-zero error type flag)
- CAN_EOIF_FLAG: Error occur interrupt flag
- CAN_TMF0TCF_FLAG: Mailbox 0 transmission complete flag
- CAN_TMF1TCF_FLAG: Mailbox 1 transmission complete flag
- CAN_TMF2TCF_FLAG: Mailbox 2 transmission complete flag
- CAN_RF0MN_FLAG: FIFO0 non-empty flag
- CAN_RF0FF_FLAG: FIFO0 full flag
- CAN_RF0OF_FLAG: FIFO0 overflow flag
- CAN_RF1MN_FLAG: FIFO1 non-empty flag
- CAN_RF1FF_FLAG: FIFO1 full flag
- CAN_RF1OF_FLAG: FIFO1 overflow flag
- CAN_QDZIF_FLAG: Quit Sleep mode flag
- CAN_EDZC_FLAG: Enter Sleep mode flag

CAN_TMEF_FLAG: Transmit mailbox empty flag (any one of three transmit mailboxes is empty)

Example:

```
/* get receive fifo 0 message num flag */
flag_status bit_status = RESET;
bit_status = can_flag_get (CAN1, CAN_RF0MN_FLAG);
```

5.4.24 can_interrupt_flag_get function

The table below describes the function can_interrupt_flag_get.

Table 95. can_interrupt_flag_get function

| Name | Description |
|------------------------|---|
| Function name | can_interrupt_flag_get |
| Function prototype | flag_status can_interrupt_flag_get(can_type* can_x, uint32_t can_flag); |
| Function description | Get the selected CAN interrupt flag |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | can_flag: indicates the selected flag Refer to the "can_flag" description below for details. |
| Output parameter | NA |
| Return value | flag_status: the status of the selected flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

can_flag

This is used to select a flag and get its status, including

- CAN_EAF_FLAG: Error active flag
- CAN_EPF_FLAG: Error passive flag
- CAN_BOF_FLAG: Bus-off flag
- CAN_ETR_FLAG: Error type record (non-zero error type flag)
- CAN_EOIF_FLAG: Error occur interrupt flag
- CAN_TM0TCF_FLAG: Mailbox 0 transmission complete flag
- CAN_TM1TCF_FLAG: Mailbox 1 transmission complete flag
- CAN_TM2TCF_FLAG: Mailbox 2 transmission complete flag
- CAN_RF0MN_FLAG: FIFO0 non-empty flag
- CAN_RF0FF_FLAG: FIFO0 full flag
- CAN_RF0OF_FLAG: FIFO0 overflow flag
- CAN_RF1MN_FLAG: FIFO1 non-empty flag
- CAN_RF1FF_FLAG: FIFO1 full flag
- CAN_RF1OF_FLAG: FIFO1 overflow flag
- CAN_QDZIF_FLAG: Quit Sleep mode flag
- CAN_EDZC_FLAG: Enter Sleep mode flag
- CAN_TMEF_FLAG: Transmit mailbox empty flag (any one of three transmit mailboxes is empty)

Example

```

/* check receive fifo 0 message num interrupt flag */
if(can_interrupt_flag_get(CAN1, CAN_RF0MN_FLAG) != RESET)
{
}

```

5.4.25 can_flag_clear function

The table below describes the function can_flag_clear.

Table 96. can_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | can_flag_clear |
| Function prototype | void can_flag_clear(can_type* can_x, uint32_t can_flag); |
| Function description | Clear the selected CAN flag |
| Input parameter 1 | can_x: indicates the selected CAN This parameter can be CAN1 or CAN2. |
| Input parameter 2 | <i>can_flag</i> : indicates the selected flag Refer to “can_flag” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

can_flag:

This is used to clear the selected flag, including:

- CAN_EAF_FLAG: Error active flag
 - CAN_EPF_FLAG: Error passive flag
 - CAN_BOF_FLAG: Bus-off flag
 - CAN_ETR_FLAG: Error type record (non-zero Error type flag)
 - CAN_EOIF_FLAG: Error occur interrupt flag
 - CAN_TM0TCF_FLAG: Mailbox 0 transmission complete flag
 - CAN_TM1TCF_FLAG: Mailbox 1 transmission complete flag
 - CAN_TM2TCF_FLAG: Mailbox 2 transmission complete flag
 - CAN_RF0FF_FLAG: FIFO0 full flag
 - CAN_RF0OF_FLAG: FIFO0 overflow flag
 - CAN_RF1FF_FLAG: FIFO1 full flag
 - CAN_RF1OF_FLAG: FIFO1 overflow flag
 - CAN_QDZIF_FLAG: Quit Sleep mode flag
 - CAN_EDZC_FLAG: Enter Sleep mode flag
 - CAN_TMEF_FLAG: Transmit mailbox empty flag (any one of three transmit mailboxes is empty)
- Note: The CAN_RF0MN_FLAG (FIFO0 non-empty flag) and CAN_RF1MN_FLAG (FIFO1 non-empty flag) have no clear operations since both are defined by software.*

Example:

```

/* clear receive fifo 0 overflow flag */
can_flag_clear (CAN1, CAN_RF1OF_FLAG);

```

5.5 CRC calculation unit (CRC)

The CRC register structure `crc_type` is defined in the “`at32f413_crc.h`”.

```
/*
 * @brief type define crc register all
 */
typedef struct
{
    ...
} crc_type;
```

The table below gives a list of the CRC registers.

Table 97. Summary of CRC registers

| Register | Description |
|----------|-------------------------------|
| dt | Data register |
| cdt | General-purpose data register |
| ctrl | Control register |
| idt | Initialization register |
| poly | Polynomial generator |

The table below gives a list of the CRC library functions.

Table 98. Summary of CRC library functions

| Function name | Description |
|--|---|
| <code>crc_data_reset</code> | Data register reset |
| <code>crc_one_word_calculate</code> | Calculate the CRC value using combination of a new 32-bit data and the previous CRC value |
| <code>crc_block_calculate</code> | Write a data block in sequence to go through CRC check and return the calculated result |
| <code>crc_data_get</code> | Get the currently calculated CRC result |
| <code>crc_common_data_set</code> | Configure common registers |
| <code>crc_common_data_get</code> | Get the value of common registers |
| <code>crc_init_data_set</code> | Set the CRC initialization register |
| <code>crc_reverse_input_data_set</code> | Set CRC input data bit reverse type |
| <code>crc_reverse_output_data_set</code> | Set CRC output data reverse type |
| <code>crc_poly_value_set</code> | Set polynomial value |
| <code>crc_poly_value_get</code> | Get polynomial value |
| <code>crc_poly_size_set</code> | Set polynomial valid width |
| <code>crc_poly_size_get</code> | Get polynomial valid width |

5.5.1 crc_data_reset function

The table below describes the function crc_data_reset.

Table 99. crc_data_reset function

| Name | Description |
|------------------------|---|
| Function name | crc_data_reset |
| Function prototype | void crc_data_reset(void); |
| Function description | When the data register is reset, the value of the initialization register is added into the data register as an initial value. The default reset value is 0xFFFFFFFF. |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* reset crc data register */
crc_data_reset();
```

5.5.2 crc_one_word_calculate function

The table below describes the function crc_one_word_calculate.

Table 100. crc_one_word_calculate function

| Name | Description |
|------------------------|--|
| Function name | crc_one_word_calculate |
| Function prototype | uint32_t crc_one_word_calculate(uint32_t data); |
| Function description | Calculate the CRC value using a combination of a new 32-bit data and the previous CRC value. |
| Input parameter 1 | data: input a 32-bit data |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint32_t: return CRC calculation result |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* calculate and return result */
uint32_t data = 0x12345678, result = 0;
result = crc_one_word_calculate (data);
```

5.5.3 crc_block_calculate function

The table below describes the function crc_block_calculate.

Table 101. crc_block_calculate function

| Name | Description |
|------------------------|--|
| Function name | crc_block_calculate |
| Function prototype | uint32_t crc_block_calculate(uint32_t *pbuffer, uint32_t length); |
| Function description | Input a data block in sequence to go through CRC calculation and return a result |
| Input parameter 1 | pbuffer: point to the data block pending for CRC check |
| Input parameter 2 | length: data block length pending for CRC check, in terms of 32-bit |
| Output parameter | NA |
| Return value | uint32_t: return CRC calculation result |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* calculate and return result */
uint32_t pbuffer[2] = {0x12345678, 0x87654321};
uint32_t result = 0;
result = crc_block_calculate (pbuffer, 2);
```

5.5.4 crc_data_get function

The table below describes the function crc_data_get.

Table 102. crc_data_get function

| Name | Description |
|------------------------|---|
| Function name | crc_data_get |
| Function prototype | uint32_t crc_data_get(void); |
| Function description | Return the current CRC calculation result |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint32_t: return CRC calculation result |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get result */
uint32_t result = 0;
result = crc_data_get();
```

5.5.5 crc_common_data_set function

The table below describes the function crc_common_data_set.

Table 103. crc_common_data_set function

| Name | Description |
|------------------------|---|
| Function name | crc_common_data_set |
| Function prototype | void crc_common_data_set(uint8_t cdt_value); |
| Function description | Configure common data register |
| Input parameter 1 | cdt_value: 8-bit common data that can be used as temporary storage data |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set common data */  
crc_common_data_set (0x88);
```

5.5.6 crc_common_data_get function

The table below describes the function crc_common_data_get.

Table 104. crc_common_data_get function

| Name | Description |
|------------------------|---|
| Function name | crc_common_data_get |
| Function prototype | uint8_t crc_common_data_get(void); |
| Function description | Return the value of the common data register |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint8_t: return the value of the previously programmed common data register |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get common data */  
uint8_t cdt_value = 0;  
cdt_value = crc_common_data_get();
```

5.5.7 crc_init_data_set function

The table below describes the function `crc_init_data_set`.

Table 105. `crc_init_data_set` function

| Name | Description |
|------------------------|--|
| Function name | <code>crc_init_data_set</code> |
| Function prototype | <code>void crc_init_data_set(uint32_t value);</code> |
| Function description | Set the value of the CRC initialization register |
| Input parameter 1 | value: the value of the CRC initialization register |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

After the value of the CRC initialization register is programmed, the CRC data register is updated with this value whenever the `crc_data_reset` function is called.

Example:

```
/* set initial data */
uint32_t init_value = 0x11223344;
crc_init_data_set (init_value);
```

5.5.8 crc_reverse_input_data_set function

The table below describes the function `crc_reverse_input_data_set`.

Table 106. `crc_reverse_input_data_set` function

| Name | Description |
|------------------------|---|
| Function name | <code>crc_reverse_input_data_set</code> |
| Function prototype | <code>void crc_reverse_input_data_set(crc_reverse_input_type value);</code> |
| Function description | Define the CRC input data bit reverse type |
| Input parameter 1 | value: input data bit reverse type |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

Define the reverse type of input data bit.

`CRC_REVERSE_INPUT_NO_AFFECTE`: No effect

`CRC_REVERSE_INPUT_BY_BYTE`: Byte reverse

`CRC_REVERSE_INPUT_BY_HALFWORD`: Half-word reverse

`CRC_REVERSE_INPUT_BY_WORD`: Word reverse

Example:

```
/* set input data reversing type */
crc_reverse_input_data_set(CRC_REVERSE_INPUT_BY_WORD);
```

5.5.9 crc_reverse_output_data_set function

The table below describes the function crc_reverse_output_data_set.

Table 107. crc_reverse_output_data_set function

| Name | Description |
|------------------------|--|
| Function name | crc_reverse_output_data_set |
| Function prototype | void crc_reverse_output_data_set(crc_reverse_output_type value); |
| Function description | Define the CRC output data reverse type |
| Input parameter 1 | value: output data bit reverse type |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

Define the reverse type of output data bit.

CRC_REVERSE_OUTPUT_NO_AFFECTE: No effect

CRC_REVERSE_OUTPUT_DATA: Word reverse

Example:

```
/* set output data reversing type */
crc_reverse_output_data_set (CRC_REVERSE_OUTPUT_DATA);
```

5.5.10 crc_poly_value_set function

The table below describes the function crc_poly_value_set.

Table 108. crc_poly_value_set function

| Name | Description |
|------------------------|--|
| Function name | crc_poly_value_set |
| Function prototype | void crc_poly_value_set(uint32_t value); |
| Function description | Set CRC polynomial value |
| Input parameter 1 | value: polynomial value |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example

```
/* set poly value */
crc_poly_value_set(0x12345671);
```

5.5.11 crc_poly_value_get function

The table below describes the function crc_poly_value_get.

Table 109. crc_poly_value_get function

| Name | Description |
|------------------------|------------------------------------|
| Function name | crc_poly_value_get |
| Function prototype | uint32_t crc_poly_value_get(void); |
| Function description | Get CRC polynomial value |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint32_t: return polynomial value |
| Required preconditions | NA |
| Called functions | NA |

Example

```
/* get poly value */
uint32_t poly = 0;
poly = crc_poly_value_get();
```

5.5.12 crc_poly_size_set function

The table below describes the function crc_poly_size_set.

Table 110. crc_poly_size_set function

| Name | Description |
|------------------------|--|
| Function name | crc_poly_size_set |
| Function prototype | void crc_poly_size_set(crc_poly_size_type size); |
| Function description | Set CRC polynomial valid width |
| Input parameter 1 | size: polynomial valid width |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

size

Define the valid width of polynomial.

- CRC_POLY_SIZE_32B: 32-bit
- CRC_POLY_SIZE_16B: 16-bit
- CRC_POLY_SIZE_8B: 8-bit
- CRC_POLY_SIZE_7B: 7-bit

Example

```
/* set poly size 32-bit */
crc_poly_size_set(CRC_POLY_SIZE_32B);
```

5.5.13 crc_poly_size_get function

The table below describes the function `crc_poly_size_get`.

Table 111. `crc_poly_size_get` function

| Name | Description |
|------------------------|--|
| Function name | <code>crc_poly_size_get</code> |
| Function prototype | <code>crc_poly_size_type crc_poly_size_get(void);</code> |
| Function description | Get CRC polynomial valid width |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | <code>crc_poly_size_type</code> : polynomial valid width |
| Required preconditions | NA |
| Called functions | NA |

`crc_poly_size_type`

Define the valid width of polynomial.

CRC_POLY_SIZE_32B: 32-bit
CRC_POLY_SIZE_16B: 16-bit
CRC_POLY_SIZE_8B: 8-bit
CRC_POLY_SIZE_7B: 7-bit

Example

```
/* get poly size */  
crc_poly_size_type size;  
size = crc_poly_size_get();
```

5.6 Clock and reset management (CRM)

5.6.1 crm_reset function

The table below describes the function crm_reset.

Table 112. crm_reset function

| Name | Description |
|------------------------|--|
| Function name | crm_reset |
| Function prototype | void crm_reset(void); |
| Function description | Reset the clock reset management register and control status |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

1. This function does not change the HICKTRIM[5:0] in the CRM_CTRL register.
2. Modifying the function does not reset the CRM_BPDC and CRM_CTRLSTS registers.

Example:

```
/* reset crm */
crm_reset();
```

5.6.2 crm_lext_bypass function

The table below describes the function crm_lext_bypass.

Table 113. crm_lext_bypass function

| Name | Description |
|------------------------|---|
| Function name | crm_lext_bypass |
| Function prototype | void crm_lext_bypass(confirm_state new_state); |
| Function description | Configure low-speed external clock bypass |
| Input parameter 1 | new_state: Enable bypass (TRUE), disable bypass (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | The LEXT configuration must be done before being enabled. |
| Called functions | NA |

Example:

```
/* enable lext bypass mode */
crm_lext_bypass(TRUE);
```

5.6.3 crm_hext_bypass function

The table below describes the function crm_hext_bypass.

Table 114. crm_hext_bypass function

| Name | Description |
|------------------------|---|
| Function name | crm_hext_bypass |
| Function prototype | void crm_hext_bypass(confirm_state new_state); |
| Function description | Configure high-speed external clock bypass |
| Input parameter 1 | new_state: Enable bypass (TRUE), disable bypass (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | The HEXT configuration must be done before being enabled. |
| Called functions | NA |

Example:

```
/* enable hext bypass mode */
crm_hext_bypass(TRUE);
```

5.6.4 crm_flag_get function

The table below describes the function crm_flag_get.

Table 115. crm_flag_get function

| Name | Description |
|------------------------|---|
| Function name | crm_flag_get |
| Function prototype | flag_status crm_flag_get(uint32_t flag); |
| Function description | Check if the selected flag has been set. |
| Input parameter 1 | flag: flag selection |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | flag_status: indicates the status of the selected flag (SET or RESET) |
| Required preconditions | NA |
| Called functions | NA |

flag

Select a flag to read, including:

| | |
|--------------------------|----------------------------------|
| CRM_HICK_STABLE_FLAG: | HICK clock stable flag |
| CRM_HEXT_STABLE_FLAG: | HEXT clock stable flag |
| CRM_PLL_STABLE_FLAG: | PLL clock stable flag |
| CRM_LEXT_STABLE_FLAG: | LEXT clock stable flag |
| CRM_LICK_STABLE_FLAG: | LICK clock stable flag |
| CRM_NRST_RESET_FLAG: | NRST pin reset flag |
| CRM_POR_RESET_FLAG: | Power-on/low voltage reset flag |
| CRM_SW_RESET_FLAG: | Software reset flag |
| CRM_WDT_RESET_FLAG: | Watchdog reset flag |
| CRM_WWDT_RESET_FLAG: | Window watchdog reset flag |
| CRM_LOWPOWER_RESET_FLAG: | Low-power consumption reset flag |

| | |
|-----------------------------|---------------------------------|
| CRM_LICK_READY_INT_FLAG: | LICK clock ready interrupt flag |
| CRM_LEXT_READY_INT_FLAG: | LEXT clock ready interrupt flag |
| CRM_HICK_READY_INT_FLAG: | HICK clock ready interrupt flag |
| CRM_HEXT_READY_INT_FLAG: | HEXT clock ready interrupt flag |
| CRM_PLL_READY_INT_FLAG: | PLL clock ready interrupt flag |
| CRM_CLOCK_FAILURE_INT_FLAG: | Clock failure interrupt flag |

Example:

```
/* wait till pll is ready */
while(crm_flag_get(CRM_PLL_STABLE_FLAG) != SET)
{
}
```

5.6.5 cmm_interrupt_flag_get function

The table below describes the function cmm_interrupt_flag_get.

Table 116. cmm_interrupt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | cmm_interrupt_flag_get |
| Function prototype | flag_status cmm_interrupt_flag_get(uint32_t flag); |
| Function description | Check if the selected flag has been set. |
| Input parameter 1 | flag: flag selection Refer to the “flag” description below for details. |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | flag_status: indicates the status of the selected flag (SET or RESET) |
| Required preconditions | NA |
| Called functions | NA |

flag

Select a flag to read, including:

| | |
|-----------------------------|---------------------------------|
| CRM_LICK_READY_INT_FLAG: | LICK clock ready interrupt flag |
| CRM_LEXT_READY_INT_FLAG: | LEXT clock ready interrupt flag |
| CRM_HICK_READY_INT_FLAG: | HICK clock ready interrupt flag |
| CRM_HEXT_READY_INT_FLAG: | HEXT clock ready interrupt flag |
| CRM_PLL_READY_INT_FLAG: | PLL clock ready interrupt flag |
| CRM_CLOCK_FAILURE_INT_FLAG: | Clock failure interrupt flag |

Example

```
/* check pll ready interrupt */
if(cmm_interrupt_flag_get(CRM_PLL_READY_INT_FLAG) != RESET)
{
}
```

5.6.6 crm_hext_stable_wait function

The table below describes the function crm_hext_stable_wait.

Table 117. crm_hext_stable_wait function

| Name | Description |
|------------------------|---|
| Function name | crm_hext_stable_wait |
| Function prototype | error_status crm_hext_stable_wait(void); |
| Function description | Wait for HEXT to activate and become stable |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | error_status: Return the status of HEXT (SUCCESS or ERROR). |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait till hext is ready */
while(crm_hext_stable_wait() == ERROR)
{
}
```

5.6.7 crm_hick_clock_trimming_set function

The table below describes the function crm_hick_clock_trimming_set.

Table 118. crm_hick_clock_trimming_set function

| Name | Description |
|------------------------|--|
| Function name | crm_hick_clock_trimming_set |
| Function prototype | void crm_hick_clock_trimming_set(uint8_t trim_value); |
| Function description | Trim HICK clock |
| Input parameter 1 | trim_value: trimming value. Default value is 0x20, and configurable range is from 0 to 0x3F. |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set trimming value */
crm_hick_clock_trimming_set(0x1F);
```

5.6.8 crm_hick_clock_calibration_set function

The table below describes the function crm_hick_clock_calibration_set.

Table 119. crm_hick_clock_calibration_set function

| Name | Description |
|------------------------|---|
| Function name | crm_hick_clock_calibration_set |
| Function prototype | void crm_hick_clock_calibration_set(uint8_t cali_value); |
| Function description | Set HICK clock calibration value |
| Input parameter 1 | cali_value: calibration compensation value. The factory gate value is the default value, and its configurable range is from 0 to 0xFF |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set trimming value */
crm_hick_clock_trimming_set(0x80);
```

5.6.9 crm_periph_clock_enable function

The table below describes the function crm_periph_clock_enable.

Table 120. crm_periph_clock_enable function

| Name | Description |
|------------------------|---|
| Function name | crm_periph_clock_enable |
| Function prototype | void crm_periph_clock_enable(crm_periph_clock_type value, confirm_state new_state); |
| Function description | Enable peripheral clock |
| Input parameter 1 | value: defines peripheral clock type |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

The crm_periph_clock_type is defined in the at32f413_crm.h.

The naming rule of this parameter is: CRM_peripheral_PERIPH_CLOCK.

CRM_DMA1_PERIPH_CLOCK: DMA1 peripheral clock

CRM_DMA2_PERIPH_CLOCK: DMA2 peripheral clock

...

CRM_PWC_PERIPH_CLOCK: PWC peripheral clock

Example:

```
/* enable gpioa periph clock */
crm_periph_clock_enable(CRM_GPIOA_PERIPH_CLOCK, TRUE);
```

5.6.10 crm_periph_reset function

The table below describes the function crm_periph_reset.

Table 121. crm_periph_reset function

| Name | Description |
|------------------------|--|
| Function name | crm_periph_reset |
| Function prototype | void crm_periph_reset(crm_periph_reset_type value, confirm_state new_state); |
| Function description | Reset peripherals |
| Input parameter 1 | value: peripheral reset type |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

This indicates the selected peripheral.

The crm_periph_reset_type is defined in the at32f413_crm.h.

The naming rule of this parameter is: CRM_peripheral_PERIPH_RESET.

CRM_DMA1_PERIPH_RESET: DMA1 peripheral reset

CRM_DMA2_PERIPH_RESET: DMA2 peripheral reset

...

CRM_PWC_PERIPH_RESET: PWC peripheral reset

Example:

```
/* reset gpioa periph */
crm_periph_reset(CRM_GPIOA_PERIPH_RESET, TRUE);
```

5.6.11 crm_periph_sleep_mode_clock_enable function

The table below describes the function crm_periph_sleep_mode_clock_enable.

Table 122. crm_periph_sleep_mode_clock_enable function

| Name | Description |
|------------------------|--|
| Function name | crm_periph_sleep_mode_clock_enable |
| Function prototype | void crm_periph_sleep_mode_clock_enable(crm_periph_clock_sleepmd_type value, confirm_state new_state); |
| Function description | Enable peripheral clock in sleep mode |
| Input parameter 1 | value: indicates peripheral clock type in sleep mode |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

It indicates the selected peripheral.

The crm_periph_clock_sleepmd_type is defined in the at32f413_crm.h.

The naming rule of this parameter is: CRM_peripheral_PERIPH_CLOCK_SLEEP_MODE.

CRM_SRAM_PERIPH_RESET: SRAM sleep mode clock definition

CRM_FLASH_PERIPH_RESET: FLASH sleep mode clock definition

Example:

```
/* disable flash clock when entry sleep mode */  
crm_periph_sleep_mode_clock_enable(CRM_FLASH_PERIPH_CLOCK_SLEEP_MODE, FALSE);
```

5.6.12 crm_clock_source_enable function

The table below describes the function crm_clock_source_enable.

Table 123. crm_clock_source_enable function

| Name | Description |
|------------------------|--|
| Function name | crm_clock_source_enable |
| Function prototype | void crm_clock_source_enable(crm_clock_source_type source, confirm_state new_state); |
| Function description | Enable clock source |
| Input parameter 1 | source: Clock source type |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

source

Clock source selection

CRM_CLOCK_SOURCE_HICK: HICK

CRM_CLOCK_SOURCE_HEXT: HEXT

CRM_CLOCK_SOURCE_PLL: PLL

CRM_CLOCK_SOURCE_LEXT: LEXT

CRM_CLOCK_SOURCE_LICK: LICK

Example:

```
/* enable hext */  
crm_clock_source_enable(CRM_CLOCK_SOURCE_HEXT, FALSE);
```

5.6.13 crm_flag_clear function

The table below describes the function crm_flag_clear

Table 124. crm_flag_clear function

| Name | Description |
|------------------------|-------------------------------------|
| Function name | crm_flag_clear |
| Function prototype | void crm_flag_clear(uint32_t flag); |
| Function description | Clear the selected flags |
| Input parameter 1 | flag: indicates the flag to clear |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

Select a flag to clear

| | |
|-----------------------------|---------------------------------|
| CRM_NRST_RESET_FLAG: | NRST pin reset flag |
| CRM_POR_RESET_FLAG: | Power-on/low-voltage reset flag |
| CRM_SW_RESET_FLAG: | Software reset flag |
| CRM_WDT_RESET_FLAG: | Watchdog reset flag |
| CRM_WWDAT_RESET_FLAG: | Window watchdog reset flag |
| CRM_LOWPOWER_RESET_FLAG: | Low-power reset flag |
| CRM_ALL_RESET_FLAG: | All reset flags |
| CRM_LICK_READY_INT_FLAG: | LICK clock ready interrupt flag |
| CRM_LEXT_READY_INT_FLAG: | LEXT clock ready interrupt flag |
| CRM_HICK_READY_INT_FLAG: | HICK clock ready interrupt flag |
| CRM_HEXT_READY_INT_FLAG: | HEXT clock ready interrupt flag |
| CRM_PLL_READY_INT_FLAG: | PLL clock ready interrupt flag |
| CRM_CLOCK_FAILURE_INT_FLAG: | Clock failure interrupt flag |

Example:

```
/* clear clock failure detection flag */  
crm_flag_clear(CRM_CLOCK_FAILURE_INT_FLAG);
```

5.6.14 crm_RTC_clock_select function

The table below describes the function crm_RTC_clock_select.

Table 125. crm_RTC_clock_select function

| Name | Description |
|------------------------|--|
| Function name | crm_RTC_clock_select |
| Function prototype | void crm_RTC_clock_select(crm_RTC_clock_type value); |
| Function description | Select RTC clock source |
| Input parameter 1 | value: indicates RTC clock source type |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

RTC clock source selection

CRM_RTC_CLOCK_NOCLK: No clock source for RTC

CRM_RTC_CLOCK_LEXT: LEXT selected as RTC clock

CRM_RTC_CLOCK_LICK: LICK selected as RTC clock

CRM_RTC_CLOCK_HEXT_DIV: HEXT/128 selected as RTC clock

Example:

```
/* config lext as rtc clock */
crm_RTC_clock_select(CRM_RTC_CLOCK_LEXT);
```

5.6.15 crm_RTC_clock_enable function

The table below describes the function crm_RTC_clock_enable.

Table 126. crm_RTC_clock_enable function

| Name | Description |
|------------------------|---|
| Function name | crm_RTC_clock_enable |
| Function prototype | void crm_RTC_clock_enable(confirm_state new_state); |
| Function description | Enable RTC clock |
| Input parameter 1 | new_state: enable (TRUE) or disable (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable rtc clock */
crm_RTC_clock_enable (TRUE);
```

5.6.16 crm_ahb_div_set function

The table below describes the function crm_ahb_div_set.

Table 127. crm_ahb_div_set function

| Name | Description |
|------------------------|---|
| Function name | crm_ahb_div_set |
| Function prototype | void crm_ahb_div_set(crm_ahb_div_type value); |
| Function description | Configure AHB clock division |
| Input parameter 1 | value: indicates the division factor |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

- CRM_AHB_DIV_1: SCLK/1 used as AHB clock
- CRM_AHB_DIV_2: SCLK/2 used as AHB clock
- CRM_AHB_DIV_4: SCLK/4 used as AHB clock
- CRM_AHB_DIV_8: SCLK/8 used as AHB clock
- CRM_AHB_DIV_16: SCLK/16 used as AHB clock
- CRM_AHB_DIV_64: SCLK/64 used as AHB clock
- CRM_AHB_DIV_128: SCLK/128 used as AHB clock
- CRM_AHB_DIV_256: SCLK/256 used as AHB clock
- CRM_AHB_DIV_512: SCLK/512 used as AHB clock

Example:

```
/* config ahbclk */
crm_ahb_div_set(CRM_AHB_DIV_1);
```

5.6.17 crm_apb1_div_set function

The table below describes the function crm_apb1_div_set.

Table 128. crm_apb1_div_set function

| Name | Description |
|------------------------|---|
| Function name | crm_apb1_div_set |
| Function prototype | void crm_apb1_div_set(crm_apb1_div_type value); |
| Function description | Configure APB1 clock division |
| Input parameter 1 | value: indicates the division factor |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

- CRM_APB1_DIV_1: APB1/1 used as APB1 clock
- CRM_APB1_DIV_2: APB1/2 used as APB1 clock

- CRM_APB1_DIV_4: AHB/4 used as APB1 clock
 CRM_APB1_DIV_8: AHB/8 used as APB1 clock
 CRM_APB1_DIV_16: AHB/16 used as APB1 clock

Example:

```
/* config apb1clk */
crm_apb1_div_set(CRM_APB1_DIV_2);
```

5.6.18 crm_apb2_div_set function

The table below describes the function crm_apb2_div_set.

Table 129. crm_apb2_div_set function

| Name | Description |
|------------------------|---|
| Function name | crm_apb2_div_set |
| Function prototype | void crm_apb2_div_set(crm_apb2_div_type value); |
| Function description | Configure APB2 clock division |
| Input parameter 1 | value: indicates the division factor |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

- CRM_APB2_DIV_1: AHB/1 used as APB2 clock
 CRM_APB2_DIV_2: AHB/2 used as APB2 clock
 CRM_APB2_DIV_4: AHB/4 used as APB2 clock
 CRM_APB2_DIV_8: AHB/8 used as APB2 clock
 CRM_APB2_DIV_16: AHB/16 used as APB2 clock

Example:

```
/* config apb2clk */
crm_apb2_div_set(CRM_APB2_DIV_2);
```

5.6.19 crm_adc_clock_div_set function

The table below describes the function crm_adc_clock_div_set.

Table 130. crm_adc_clock_div_set function

| Name | Description |
|------------------------|---|
| Function name | crm_adc_clock_div_set |
| Function prototype | void crm_adc_clock_div_set(crm_adc_div_type div_value); |
| Function description | Configure ADC clock division |
| Input parameter 1 | div_value: indicates the division factor |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

div_value

- CRM_ADC_DIV_2: APB/2 used as ADC clock
- CRM_ADC_DIV_4: APB/4 used as ADC clock
- CRM_ADC_DIV_6: APB/6 used as ADC clock
- CRM_ADC_DIV_8: APB/8 used as ADC clock
- CRM_ADC_DIV_12: APB/12 used as ADC clock
- CRM_ADC_DIV_16: APB/16 used as ADC clock

Example:

```
/* config adc div 4 */
crm_adc_clock_div_set(CRM_ADC_DIV_4);
```

5.6.20 `crm_usb_clock_div_set` function

The table below describes the function `crm_usb_clock_div_set`.

Table 131. `crm_usb_clock_div_set` function

| Name | Description |
|------------------------|--|
| Function name | <code>crm_usb_clock_div_set</code> |
| Function prototype | <code>void crm_usb_clock_div_set(crm_usb_div_type div_value);</code> |
| Function description | Configure PLL clock division |
| Input parameter 1 | <code>div_value</code> : indicates the division factor |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

div_value

- CRM_USB_DIV_1_5: PLL/1.5 used as USB clock
- CRM_USB_DIV_1: PLL/1 used as USB clock
- CRM_USB_DIV_2_5: PLL/2.5 used as USB clock
- CRM_USB_DIV_2: PLL/2 used as USB clock
- CRM_USB_DIV_3_5: PLL/3.5 used as USB clock
- CRM_USB_DIV_3: PLL/3 used as USB clock
- CRM_USB_DIV_4: PLL/4 used as USB clock

Example:

```
/* config usb div 2 */
crm_usb_clock_div_set(CRM_USB_DIV_2);
```

5.6.21 crm_clock_failure_detection_enable function

The table below describes the function crm_clock_failure_detection_enable.

Table 132. crm_clock_failure_detection_enable function

| Name | Description |
|------------------------|---|
| Function name | crm_clock_failure_detection_enable |
| Function prototype | void crm_clock_failure_detection_enable(confirm_state new_state); |
| Function description | Enable clock failure detection |
| Input parameter 1 | new_state: enable (TRUE) or disable (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable clock failure detection */
crm_clock_failure_detection_enable(TRUE);
```

5.6.22 crm_batteryPowered_domain_reset function

The table below describes the function crm_batteryPowered_domain_reset.

Table 133. crm_batteryPowered_domain_reset function

| Name | Description |
|------------------------|--|
| Function name | crm_batteryPowered_domain_reset |
| Function prototype | void crm_batteryPowered_domain_reset(confirm_state new_state); |
| Function description | Reset battery powered domain |
| Input parameter 1 | new_state: reset (TRUE) or not reset (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

When it comes to resetting battery powered domain, it is usually necessary to reset battery powered domain through TRUE operation and then disable battery powered domain reset through FALSE operation after the completion of reset.

Example:

```
/* reset battery powered domain */
crm_batteryPowered_domain_reset (TRUE);
```

5.6.23 crm_pll_config function

The table below describes the function crm_pll_config.

Table 134. crm_pll_config function

| Name | Description |
|------------------------|---|
| Function name | crm_pll_config |
| Function prototype | void crm_pll_config(crm_pll_clock_source_type clock_source, crm_pll_mult_type mult_value, crm_pll_output_range_type pll_range); |
| Function description | Configure PLL clock source and frequency multiplication factor |
| Input parameter 1 | clock_source: clock source for PLL frequency multiplication |
| Input parameter 2 | mult_value: frequency multiplication factor |
| Input parameter 3 | pll_range: configure PLL clock output range (≤ 72 MHz or > 72 MHz) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | PLL clock source must be enabled and stable before configuring and enabling PLL. |
| Called functions | NA |

clock_source

CRM_PLL_SOURCE_HICK: HICK is selected as PLL clock source

CRM_PLL_SOURCE_HEXT: HEXT is selected as PLL clock source

CRM_PLL_SOURCE_HEXT_DIV: Divided HEXT is selected as PLL clock source

mult_value

CRM_PLL_MULT_2: PLL output x 2

CRM_PLL_MULT_3: PLL output x 3

...

CRM_PLL_MULT_63: PLL output x 63

CRM_PLL_MULT_64: PLL output x 64

pll_range

CRM_PLL_OUTPUT_RANGE_LE72MHZ: Configure when PLL clock output ≤ 72 MHz

CRM_PLL_OUTPUT_RANGE_GT72MHZ: Configure when PLL clock output > 72 MHz

Example:

```
/* config pll clock resource */
crm_pll_config(CRM_PLL_SOURCE_HEXT_DIV, CRM_PLL_MULT_60,
CRM_PLL_OUTPUT_RANGE_GT72MHZ);
```

5.6.24 crm_sysclk_switch function

The table below describes the function crm_sysclk_switch.

Table 135. crm_sysclk_switch function

| Name | Description |
|------------------------|--|
| Function name | crm_sysclk_switch |
| Function prototype | void crm_sysclk_switch(crm_sclk_type value); |
| Function description | Switch system clock source |
| Input parameter 1 | value: indicates the clock source for system clock |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

CRM_SCLK_HICK: HICK is used as system clock

CRM_SCLK_HEXT: HEXT is used as system clock

CRM_SCLK_PLL: PLL is used as system clock

Example:

```
/* select pll as system clock source */
crm_sysclk_switch(CRM_SCLK_PLL);
```

5.6.25 crm_sysclk_switch_status_get function

The table below describes the function crm_sysclk_switch_status_get.

Table 136. crm_sysclk_switch_status_get function

| Name | Description |
|------------------------|--|
| Function name | crm_sysclk_switch_status_get |
| Function prototype | crm_sclk_type crm_sysclk_switch_status_get(void); |
| Function description | Get the clock source of system clock |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | crm_sclk_type: return the clock source of system clock |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait till pll is used as system clock source */
while(crm_sysclk_switch_status_get() != CRM_SCLK_PLL)
{
}
```

5.6.26 crm_clocks_freq_get function

The table below describes the function crm_clocks_freq_get.

Table 137. crm_clocks_freq_get function

| Name | Description |
|------------------------|--|
| Function name | crm_clocks_freq_get |
| Function prototype | void crm_clocks_freq_get(crm_clocks_freq_type *clocks_struct); |
| Function description | Get clock frequency |
| Input parameter 1 | clocks_struct: crm_clocks_freq_type pointer, including clock frequency |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | crm_sclk_type: return the clock source for system clock |
| Required preconditions | NA |
| Called functions | NA |

crm_clocks_freq_type

The crm_clocks_freq_type is defined in the at32f413_crm.h.

typedef struct

```
{
    uint32_t    sclk_freq;
    uint32_t    ahb_freq;
    uint32_t    apb2_freq;
    uint32_t    apb1_freq;
    uint32_t    adc_freq;
}
```

crm_clocks_freq_type;

sclk_freq

Get the system clock frequency, in Hz

ahb_freq

Get the clock frequency of AHB, in Hz

apb2_freq

Get the clock frequency of APB2, in Hz

apb1_freq

Get the clock frequency of APB1, in Hz

adc_freq

Get the clock frequency of ADC, in Hz

Example:

```
/* get frequency */
crm_clocks_freq_type clocks_struct;
crm_clocks_freq_get(&clocks_struct);
```

5.6.27 crm_clock_out_set function

The table below describes the function crm_clock_out_set.

Table 138. crm_clock_out_set function

| Name | Description |
|------------------------|--|
| Function name | crm_clock_out_set |
| Function prototype | void crm_clock_out_set(crm_clkout_select_type clkout); |
| Function description | Select clock source output on clkout pin |
| Input parameter 1 | clkout: clock source output on clkout pin |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* config PA8 output pll/4 */
crm_clock_out_set(CRM_CLKOUT_PLL_DIV_4);
```

5.6.28 crm_interrupt_enable function

The table below describes the function crm_interrupt_enable.

Table 139. crm_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | crm_interrupt_enable |
| Function prototype | void crm_interrupt_enable(uint32_t crm_int, confirm_state new_state); |
| Function description | Enable interrupts |
| Input parameter 1 | crm_int: indicates the selected crm interrupt |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

crm_int

| | |
|------------------------|----------------------------|
| CRM_LICK_STABLE_INT: | LICK stable interrupt |
| CRM_LEXT_STABLE_INT: | LEXT stable interrupt |
| CRM_HICK_STABLE_INT: | HICK stable interrupt |
| CRM_HEXT_STABLE_INT: | HEXT stable interrupt |
| CRM_PLL_STABLE_INT: | PLL clock stable interrupt |
| CRM_CLOCK_FAILURE_INT: | Clock failure interrupt |

Example:

```
/* enable pll stable interrupt */
crm_interrupt_enable (CRM_PLL_STABLE_INT);
```

5.6.29 crm_auto_step_mode_enable function

The table below describes the function crm_auto_step_mode_enable.

Table 140. crm_auto_step_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | crm_auto_step_mode_enable |
| Function prototype | void crm_auto_step_mode_enable(confirm_state new_state); |
| Function description | Enable auto step-by-step mode |
| Input parameter 1 | new_state: enable (TRUE) or disable (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable auto step mode */
crm_auto_step_mode_enable(TRUE);
```

5.6.30 crm_usb_interrupt_remapping_set function

The table below describes the function crm_usb_interrupt_remapping_set.

Table 141. crm_usb_interrupt_remapping_set function

| Name | Description |
|------------------------|---|
| Function name | crm_usb_interrupt_remapping_set |
| Function prototype | void crm_usb_interrupt_remapping_set(crm_usb_int_map_type int_remap); |
| Function description | Configure USB interrupt remapping |
| Input parameter 1 | int_remap: USB interrupt selection |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

int_remap

CRM_USB_INT19_INT20: USB uses the 19th and 20th interrupt

CRM_USB_INT73_INT74: USB uses the 73rd and 74th interrupt

Example:

```
/* config usb IRQ number with 73/74 */
crm_usb_interrupt_remapping_set(CRM_USB_INT73_INT74);
```

5.6.31 crm_hick_sclk_frequency_select function

The table below describes the function crm_hick_sclk_frequency_select.

Table 142. crm_hick_sclk_frequency_select function

| Name | Description |
|------------------------|---|
| Function name | crm_hick_sclk_frequency_select |
| Function prototype | void crm_hick_sclk_frequency_select(crm_hick_sclk_frequency_type value); |
| Function description | Select 8M or 48M system clock frequency when HICK is used as system clock |
| Input parameter 1 | value: 8M or 48M HICK |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

CRM_HICK_SCLK_8MHZ: 8 MHz HICK used as system clock

CRM_HICK_SCLK_48MHZ: 48 MHz HICK used as system clock

Example:

```
/* config sysclk with hick 48mhz */
crm_hick_sclk_frequency_select (CRM_HICK_SCLK_48MHZ);
```

5.6.32 crm_usb_clock_source_select function

The table below describes the function crm_usb_clock_source_select.

Table 143. crm_usb_clock_source_select function

| Name | Description |
|------------------------|--|
| Function name | crm_usb_clock_source_select |
| Function prototype | void crm_usb_clock_source_select(crm_usb_clock_source_type value); |
| Function description | Select PLL or HICK (48M) as USB clock source |
| Input parameter 1 | value: PLL or HICK (48M) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

CRM_USB_CLOCK_SOURCE_PLL: PLL is used as USB clock source

CRM_USB_CLOCK_SOURCE_HICK: HICK is used as USB clock source

Example:

```
/* select hick48 as usb clock */
crm_usb_clock_source_select (CRM_USB_CLOCK_SOURCE_HICK);
```

5.6.33 crm_clkout_to_tmr10_enable function

The table below describes the function crm_clkout_to_tmr10_enable.

Table 144. crm_clkout_to_tmr10_enable function

| Name | Description |
|------------------------|---|
| Function name | crm_clkout_to_tmr10_enable |
| Function prototype | void crm_clkout_to_tmr10_enable(confirm_state new_state); |
| Function description | Enable the clkout to tmr10 channel 1 |
| Input parameter 1 | new_state: enable (TRUE) or disable (FALSE) |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* config clkout internal connect to tmr10 channel1 */
crm_clkout_to_tmr10_enable (TRUE);
```

5.6.34 crm_clkout_div_set function

The table below describes the function crm_clkout_div_set.

Table 145. crm_clkout_div_set function

| Name | Description |
|------------------------|--|
| Function name | crm_clkout_div_set |
| Function prototype | void crm_clkout_div_set(crm_clkout_div_type clkout_div); |
| Function description | Clock frequency division on clkout pin |
| Input parameter 1 | clkout_div: clkout frequency division |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

value

| | |
|---------------------|-----------------------------|
| CRM_CLKOUT_DIV_1: | Clock output divided by 1 |
| CRM_CLKOUT_DIV_2: | Clock output divided by 2 |
| CRM_CLKOUT_DIV_4: | Clock output divided by 4 |
| CRM_CLKOUT_DIV_8: | Clock output divided by 8 |
| CRM_CLKOUT_DIV_16: | Clock output divided by 16 |
| CRM_CLKOUT_DIV_64: | Clock output divided by 64 |
| CRM_CLKOUT_DIV_128: | Clock output divided by 128 |
| CRM_CLKOUT_DIV_256: | Clock output divided by 256 |
| CRM_CLKOUT_DIV_512: | Clock output divided by 512 |

Example:

```
/* config clkout division */
crm_clkout_div_set(CRM_CLKOUT_DIV_1);
```

5.7 Debug

The DEBUG register structure debug_type is defined in the “at32f413_debug.h”.

```
/*
 * @brief type define debug register all
 */
typedef struct
{
    ...
} debug_type;
```

The table below gives a list of the DEBUG registers.

Table 146. Summary of DEBUG registers

| Register | Description |
|----------|------------------|
| idcode | Device ID |
| ctrl | Control register |

The table below gives a list of the DEBUG library functions.

Table 147. Summary of DEBUG library functions

| Function name | Description |
|-----------------------|-------------------------------------|
| debug_device_id_get | Read device idcode |
| debug_periph_mode_set | Peripheral debug mode configuration |

5.7.1 debug_device_id_get function

The table below describes the function debug_device_id_get.

Table 148. debug_device_id_get function

| Name | Description |
|------------------------|-------------------------------------|
| Function name | debug_device_id_get |
| Function prototype | uint32_t debug_device_id_get(void); |
| Function description | Read device idcode |
| Input parameter 1 | NA |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | Return 32-bit idcode |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get idcode */
uint32_t idcode = 0;
idcode = debug_device_id_get();
```

5.7.2 debug_periph_mode_set function

The table below describes the function debug_periph_mode_set.

Table 149. debug_periph_mode_set function

| Name | Description |
|------------------------|--|
| Function name | debug_periph_mode_set |
| Function prototype | void debug_periph_mode_set(uint32_t periph_debug_mode, confirm_state new_state); |
| Function description | Select a peripheral/mode to debug |
| Input parameter 1 | periph_debug_mode: select a peripheral or mode |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

periph_debug_mode

Select a peripheral or mode to debug

| | |
|---------------------------|---|
| DEBUG_SLEEP: | Debug in Sleep mode |
| DEBUG_DEEPSLEEP: | Debug in Deepsleep mode |
| DEBUG_STANDBY: | Debug in Standby mode |
| DEBUG_WDT_PAUSE: | Watchdog pause control bit |
| DEBUG_WWDT_PAUSE: | Window watchdog pause control bit |
| DEBUG_TMR1_PAUSE: | TMR1 pause control bit |
| DEBUG_TMR2_PAUSE: | TMR2 pause control bit |
| DEBUG_TMR3_PAUSE: | TMR3 pause control bit |
| DEBUG_TMR4_PAUSE: | TMR4 pause control bit |
| DEBUG_TMR5_PAUSE: | TMR5 pause control bit |
| DEBUG_TMR8_PAUSE: | TMR8 pause control bit |
| DEBUG_TMR9_PAUSE: | TMR9 pause control bit |
| DEBUG_TMR10_PAUSE: | TMR10 pause control bit |
| DEBUG_TMR11_PAUSE: | TMR11 pause control bit |
| DEBUG_I2C1_SMBUS_TIMEOUT: | I2C1 SMBUS TIMEOUT pause control bit |
| DEBUG_I2C2_SMBUS_TIMEOUT: | I2C2 SMBUS TIMEOUT pause control bit |
| DEBUG_CAN1_PAUSE: | CAN1 receive register pause control bit |

Example:

```
/* enable tmr1 debug mode */
debug_periph_mode_set(DEBUG_TMR1_PAUSE, TRUE);
```

5.8 DMA controller

The DMA register structure `dma_type` is defined in the “`at32f413_dma.h`”.

```
/*
 * @brief type define dma register
 */
typedef struct
{
    ...
} dma_type;
```

The DMA channel register structure `dma_channel_type` is defined in the “`at32f413_dma.h`”.

```
/*
 * @brief type define dma channel register all
 */
typedef struct
{
    ...
} dma_channel_type;
```

The table below gives a list of the DMA registers.

Table 150. Summary of DMA registers

| Register | Description |
|--------------------------|---|
| <code>dma_sts</code> | DMA status register |
| <code>dma_clr</code> | DMA status clear register |
| <code>dma_c1ctrl</code> | DMA channel 1 configuration register |
| <code>dma_c1dtcnt</code> | DMA channel 1 number of data register |
| <code>dma_c1paddr</code> | DMA channel 1 peripheral address register |
| <code>dma_c1maddr</code> | DMA channel 1 memory address register |
| <code>dma_c2ctrl</code> | DMA channel 2 configuration register |
| <code>dma_c2dtcnt</code> | DMA channel 2 number of data register |
| <code>dma_c2paddr</code> | DMA channel 2 peripheral address register |
| <code>dma_c2maddr</code> | DMA channel 2 memory address register |
| <code>dma_c3ctrl</code> | DMA channel 3 configuration register |
| <code>dma_c3dtcnt</code> | DMA channel 3 number of data register |
| <code>dma_c3paddr</code> | DMA channel 3 peripheral address register |
| <code>dma_c3maddr</code> | DMA channel 3 memory address register |
| <code>dma_c4ctrl</code> | DMA channel 4 configuration register |
| <code>dma_c4dtcnt</code> | DMA channel 4 number of data register |
| <code>dma_c4paddr</code> | DMA channel 4 peripheral address register |
| <code>dma_c4maddr</code> | DMA channel 4 memory address register |
| <code>dma_c5ctrl</code> | DMA channel 5 configuration register |
| <code>dma_c5dtcnt</code> | DMA channel 5 number of data register |

| Register | Description |
|--------------|---|
| dma_c5paddr | DMA channel 5 peripheral address register |
| dma_c5maddr | DMA channel 5 memory address register |
| dma_c6ctrl | DMA channel 6 configuration register |
| dma_c6dtcnt | DMA channel 6 number of data register |
| dma_c6paddr | DMA channel 6 peripheral address register |
| dma_c6maddr | DMA channel 6 memory address register |
| dma_c7ctrl | DMA channel 7 configuration register |
| dma_c7dtcnt | DMA channel 7 number of data register |
| dma_c7paddr | DMA channel 7 peripheral address register |
| dma_c7maddr | DMA channel 7 memory address register |
| dma_src_sel0 | Channel source register 0 |
| dma_src_sel1 | Channel source register 1 |

The table below gives a list of the DMA library functions.

Table 151. Summary of DMA library functions

| Function name | Description |
|-----------------------|--|
| dma_default_para_init | Initialize parameters of the dma_init_struct |
| dma_init | Initialize the selected DMA channel |
| dma_reset | Reset the selected DMA channel |
| dma_data_number_set | Set the number of data transfer of a given channel |
| dma_data_number_get | Get the number of data transfer of a given channel |
| dma_interrupt_enable | Enable DMA channel interrupt |
| dma_channel_enable | Enable DMA channel |
| dma_flexible_config | Configure flexible DMA request mapping |
| dma_flag_get | Get the flag of DMA channels |
| dma_flag_clear | Clear the flag of DMA channels |

5.8.1 dma_default_para_init function

The table below describes the function dma_default_para_init.

Table 152. dma_default_para_init function

| Name | Description |
|------------------------|---|
| Function name | dma_default_para_init |
| Function prototype | void dma_default_para_init(dma_init_type* dma_init_struct); |
| Function description | Initialize parameters in the dma_init_struct |
| Input parameter 1 | dma_init_struct: dma_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The table below describes the default values of dma_init_struct members.

Table 153. dma_init_struct default values

| Member | Default value |
|-----------------------|--------------------------------|
| peripheral_base_addr | 0x0 |
| memory_base_addr | 0x0 |
| direction | DMA_DIR_PERIPHERAL_TO_MEMORY |
| buffer_size | 0x0 |
| peripheral_inc_enable | FALSE |
| memory_inc_enable | FALSE |
| peripheral_data_width | DMA_PERIPHERAL_DATA_WIDTH_BYTE |
| memory_data_width | DMA_MEMORY_DATA_WIDTH_BYTE |
| loop_mode_enable | FALSE |
| priority | DMA_PRIORITY_LOW |

Example:

```
/* dma init config with its default value */
dma_init_type dma_init_struct = {0};
dma_default_para_init(&dma_init_struct);
```

5.8.2 dma_init function

The table below describes the function dma_init.

Table 154. dma_init function

| Name | Description |
|------------------------|--|
| Function name | dma_init |
| Function prototype | void dma_init(dma_channel_type* dmax_channely, dma_init_type* dma_init_struct) |
| Function description | Initialize the selected DMA channel |
| Input parameter 1 | dmax_channely: DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Input parameter 2 | dma_init_struct: dma_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

dma_init_type structure

The dma_init_type is defined in the at32f413_dma.h.

typedef struct

```
{
    uint32_t          peripheral_base_addr;
    uint32_t          memory_base_addr;
    dma_dir_type      direction;
    uint16_t          buffer_size;
    confirm_state     peripheral_inc_enable;
    confirm_state     memory_inc_enable;
    dma_peripheral_data_size_type peripheral_data_width;
```

```
    dma_memory_data_size_type      memory_data_width;
    confirm_state                  loop_mode_enable;
    dma_priority_level_type       priority;
} dma_init_type;

peripheral_base_addr
Set the peripheral address of a DMA channel

memory_base_addr
Set the memory address of a DMA channel.

direction
Set the transfer direction of a DMA channel
DMA_DIR_PERIPHERAL_TO_MEMORY:   Peripheral to memory
DMA_DIR_MEMORY_TO_PERIPHERAL:   Memory to peripheral
DMA_DIR_MEMORY_TO_MEMORY:       Memory to memory

buffer_size
Set the number of data transfer of a DMA channel.

peripheral_inc_enable
Enable/disable DMA channel peripheral address auto increment.
FALSE: Peripheral address is not incremented
TRUE:  Peripheral address is incremented

memory_inc_enable
Enable/disable DMA channel memory address auto increment.
FALSE: Memory address is not incremented
TRUE:  Memory address is incremented

peripheral_data_width
Set DMA peripheral data width.
DMA_PERIPHERAL_DATA_WIDTH_BYTE:  Byte
DMA_PERIPHERAL_DATA_WIDTH_HALFWORD: Half-word
DMA_PERIPHERAL_DATA_WIDTH_WORD:   Word

memory_data_width
Set DMA memory data width.
DMA_MEMORY_DATA_WIDTH_BYTE:     Byte
DMA_MEMORY_DATA_WIDTH_HALFWORD: Half-word
DMA_MEMORY_DATA_WIDTH_WORD:     Word

loop_mode_enable
Set DMA loop mode.
FALSE: DMA single mode
TRUE:  DMA loop mode

priority
Set DMA channel priority.
DMA_PRIORITY_LOW:        Low
DMA_PRIORITY_MEDIUM:     Medium
DMA_PRIORITY_HIGH:       High
DMA_PRIORITY VERY_HIGH: Very high
```

Example:

```
dma_init_type dma_init_struct = {0};  
/* dma2 channel1 configuration */  
dma_init_struct.buffer_size = BUFFER_SIZE;  
dma_init_struct.direction = DMA_DIR_MEMORY_TO_PERIPHERAL;  
dma_init_struct.memory_base_addr = (uint32_t)src_buffer;  
dma_init_struct.memory_data_width = DMA_MEMORY_DATA_WIDTH_HALFWORD;  
dma_init_struct.memory_inc_enable = TRUE;  
dma_init_struct.peripheral_base_addr = (uint32_t)0x4001100C;  
dma_init_struct.peripheral_data_width = DMA_PERIPHERAL_DATA_WIDTH_HALFWORD;  
dma_init_struct.peripheral_inc_enable = FALSE;  
dma_init_struct.priority = DMA_PRIORITY_MEDIUM;  
dma_init_struct.loop_mode_enable = FALSE;  
dma_init(DMA2_CHANNEL1, &dma_init_struct);
```

5.8.3 **dma_reset** function

The table below describes the function `dma_reset`.

Table 155. `dma_reset` function

| Name | Description |
|------------------------|---|
| Function name | <code>dma_reset</code> |
| Function prototype | <code>void dma_reset(dma_channel_type* dmax_channel);</code> |
| Function description | Reset the selected DMA channel |
| Input parameter 1 | <code>dmax_channel</code> : DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* reset dma2 channel1 */  
dma_reset(DMA2_CHANNEL1);
```

5.8.4 dma_data_number_set function

The table below describes the function dma_data_number_set.

Table 156. dma_data_number_set function

| Name | Description |
|------------------------|--|
| Function name | dma_data_number_set |
| Function prototype | void dma_data_number_set(dma_channel_type* dmax_channely, uint16_t data_number); |
| Function description | Set the number of data transfer of the selected DMA channel |
| Input parameter 1 | dmax_channely: DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Input parameter 2 | data_number: indicates the number of data transfer, up to 65535 |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* set dma2 channel1 data count is 0x100*/
dma_data_number_set(DMA2_CHANNEL1, 0x100);
```

5.8.5 dma_data_number_get function

The table below describes the function dma_data_number_get.

Table 157. dma_data_number_get function

| Name | Description |
|------------------------|--|
| Function name | dma_data_number_get |
| Function prototype | uint16_t dma_data_number_get(dma_channel_type* dmax_channely); |
| Function description | Get the number of data transfer of the selected DMA channel |
| Input parameter 1 | dmax_channely: DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Output parameter | NA |
| Return value | Get the number of data transfer of a DMA channel |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get dma2 channel1 data count/
uint16_t data_counter;
data_counter = dma_data_number_get(DMA2_CHANNEL1);
```

5.8.6 dma_interrupt_enable function

The table below describes the function dma_interrupt_enable.

Table 158. dma_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | dma_interrupt_enable |
| Function prototype | void dma_interrupt_enable(dma_channel_type* dmax_channely, uint32_t dma_int, confirm_state new_state); |
| Function description | Enable DMA channel interrupt |
| Input parameter 1 | dmax_channely: DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Input parameter 2 | dma_int: interrupt source selection |
| Input parameter 3 | new_state: interrupt enable/disable |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

dma_int

Select DMA interrupt source

DMA_FDT_INT: Transfer complete interrupt

DMA_HDT_INT: Half transfer complete interrupt

DMA_DTERR_INT: Transfer error interrupt

new_state

Enable or disable DMA channel interrupt

FALSE: Disabled

TRUE: Enabled

Example:

```
/* enable dma2 channel1 transfer full data intterrupt */  
dma_interrupt_enable(DMA2_CHANNEL1, DMA_FDT_INT, TRUE);
```

5.8.7 dma_channel_enable function

The table below describes the function `dma_interrupt_enable`

Table 159. `dma_channel_enable` function

| Name | Description |
|------------------------|---|
| Function name | <code>dma_channel_enable</code> |
| Function prototype | <code>void dma_channel_enable(dma_channel_type* dmax_channely, confirm_state new_state);</code> |
| Function description | Enable the selected DMA channel |
| Input parameter 1 | <code>dmax_channely</code> : DMAx_CHANNELy defines a DMA channel number, x=1 or 2, y=1...7 |
| Input parameter 2 | <code>new_state</code> : Enable or disable the selected DMA channel |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

`new_state`

Enable or disable DMA channels

FALSE: Disabled

TRUE: Enabled

Example:

```
/* enable dma channel */
dma_channel_enable(DMA2_CHANNEL1, TRUE);
```

5.8.8 dma_flexible_config function

The table below describes the function `dma_flexible_config`.

Table 160. `dma_flexible_config` function

| Name | Description |
|------------------------|--|
| Function name | <code>dma_flexible_config</code> |
| Function prototype | <code>void dma_flexible_config(dma_type* dma_x, uint8_t flex_channelx, dma_flexible_request_type flexible_request);</code> |
| Function description | Configure flexible DMA request mapping |
| Input parameter 1 | <code>dma_x</code> : select DMAx, x=1 or 2 |
| Input parameter 2 | <code>flex_channelx</code> : FLEX_CHANNELx defines a DMA channel number, x=1...7 |
| Input parameter 3 | <code>flexible_request</code> : channel request ID |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

`flexible_request`

The table below shows the DMA channel request ID.

Table 161. DMA channel request source ID

| Request source ID | Description | Request source ID | Description |
|-------------------|----------------------------|-------------------|----------------------------|
| 0x01 | DMA_FLEXIBLE_ADC1 | 0x0A | DMA_FLEXIBLE_SPI1_TX |
| 0x09 | DMA_FLEXIBLE_SPI1_RX | 0x0C | DMA_FLEXIBLE_SPI2_TX |
| 0x0B | DMA_FLEXIBLE_SPI2_RX | 0x1A | DMA_FLEXIBLE_UART1_TX |
| 0x19 | DMA_FLEXIBLE_UART1_RX | 0x1C | DMA_FLEXIBLE_UART2_TX |
| 0x1B | DMA_FLEXIBLE_UART2_RX | 0x1E | DMA_FLEXIBLE_UART3_TX |
| 0x1D | DMA_FLEXIBLE_UART3_RX | 0x20 | DMA_FLEXIBLE_UART4_TX |
| 0x1F | DMA_FLEXIBLE_UART4_RX | 0x22 | DMA_FLEXIBLE_UART5_TX |
| 0x21 | DMA_FLEXIBLE_UART5_RX | 0x2A | DMA_FLEXIBLE_I2C1_TX |
| 0x29 | DMA_FLEXIBLE_I2C1_RX | 0x2C | DMA_FLEXIBLE_I2C2_TX |
| 0x2B | DMA_FLEXIBLE_I2C2_RX | 0x36 | DMA_FLEXIBLE_TMR1_HALL |
| 0x31 | DMA_FLEXIBLE_SDIO1 | 0x38 | DMA_FLEXIBLE_TMR1_CH1 |
| 0x35 | DMA_FLEXIBLE_TMR1_TRIG | 0x3A | DMA_FLEXIBLE_TMR1_CH3 |
| 0x37 | DMA_FLEXIBLE_TMR1_OVERFLOW | 0x3D | DMA_FLEXIBLE_TMR2_TRIG |
| 0x39 | DMA_FLEXIBLE_TMR1_CH2 | 0x40 | DMA_FLEXIBLE_TMR2_CH1 |
| 0x3B | DMA_FLEXIBLE_TMR1_CH4 | 0x42 | DMA_FLEXIBLE_TMR2_CH3 |
| 0x3F | DMA_FLEXIBLE_TMR2_OVERFLOW | 0x45 | DMA_FLEXIBLE_TMR3_TRIG |
| 0x41 | DMA_FLEXIBLE_TMR2_CH2 | 0x48 | DMA_FLEXIBLE_TMR3_CH1 |
| 0x43 | DMA_FLEXIBLE_TMR2_CH4 | 0x4A | DMA_FLEXIBLE_TMR3_CH3 |
| 0x47 | DMA_FLEXIBLE_TMR3_OVERFLOW | 0x4D | DMA_FLEXIBLE_TMR4_TRIG |
| 0x49 | DMA_FLEXIBLE_TMR3_CH2 | 0x50 | DMA_FLEXIBLE_TMR4_CH1 |
| 0x4B | DMA_FLEXIBLE_TMR3_CH4 | 0x52 | DMA_FLEXIBLE_TMR4_CH3 |
| 0x4F | DMA_FLEXIBLE_TMR4_OVERFLOW | 0x55 | DMA_FLEXIBLE_TMR5_TRIG |
| 0x51 | DMA_FLEXIBLE_TMR4_CH2 | 0x58 | DMA_FLEXIBLE_TMR5_CH1 |
| 0x53 | DMA_FLEXIBLE_TMR4_CH4 | 0x5A | DMA_FLEXIBLE_TMR5_CH3 |
| 0x57 | DMA_FLEXIBLE_TMR5_OVERFLOW | 0x6D | DMA_FLEXIBLE_TMR8_TRIG |
| 0x59 | DMA_FLEXIBLE_TMR5_CH2 | 0x6F | DMA_FLEXIBLE_TMR8_OVERFLOW |
| 0x5B | DMA_FLEXIBLE_TMR5_CH4 | 0x71 | DMA_FLEXIBLE_TMR8_CH2 |
| 0x6E | DMA_FLEXIBLE_TMR8_HALL | 0x73 | DMA_FLEXIBLE_TMR8_CH4 |
| 0x70 | DMA_FLEXIBLE_TMR8_CH1 | 0x72 | DMA_FLEXIBLE_TMR8_CH3 |

Example:

```
/* tmr2 flexible function enable */
dma_flexible_config(DMA2, FLEX_CHANNEL1, DMA_FLEXIBLE_TMR2_OVERFLOW);
```

5.8.9 dma_flag_get function

The table below describes the function `dma_flag_get`.

Table 162. `dma_flag_get` function

| Name | Description |
|------------------------|---|
| Function name | <code>dma_flag_get</code> |
| Function prototype | <code>flag_status dma_flag_get(uint32_t dmax_flag);</code> |
| Function description | Get the flag of the selected DMA channel |
| Input parameter 1 | <i>dmax_flag</i> : select the desired flag |
| Output parameter | NA |
| Return value | <code>flag_status</code> : indicates whether the desired flag is set or not |
| Required preconditions | NA |
| Called functions | NA |

dmax_flag

The `dmax_flag` is used for flag section, including:

| | |
|-------------------|--|
| DMA1_GL1_FLAG: | DMA1 channel 1 global flag |
| DMA1_FDT1_FLAG: | DMA1 channel 1 transfer complete flag |
| DMA1_HDT1_FLAG: | DMA1 channel 1 half transfer complete flag |
| DMA1_DTERR1_FLAG: | DMA1 channel 1 transfer error flag |
| DMA1_GL2_FLAG: | DMA1 channel 2 global flag |
| DMA1_FDT2_FLAG: | DMA1 channel 2 transfer complete flag |
| DMA1_HDT2_FLAG: | DMA1 channel 2 half transfer complete flag |
| DMA1_DTERR2_FLAG: | DMA1 channel 2 transfer error flag |
| DMA1_GL3_FLAG: | DMA1 channel 3 global flag |
| DMA1_FDT3_FLAG: | DMA1 channel 3 transfer complete flag |
| DMA1_HDT3_FLAG: | DMA1 channel 3 half transfer complete flag |
| DMA1_DTERR3_FLAG: | DMA1 channel 3 transfer error flag |
| DMA1_GL4_FLAG: | DMA1 channel 4 global flag |
| DMA1_FDT4_FLAG: | DMA1 channel 4 transfer complete flag |
| DMA1_HDT4_FLAG: | DMA1 channel 4 half transfer complete flag |
| DMA1_DTERR4_FLAG: | DMA1 channel 4 transfer error flag |
| DMA1_GL5_FLAG: | DMA1 channel 5 global flag |
| DMA1_FDT5_FLAG: | DMA1 channel 5 transfer complete flag |
| DMA1_HDT5_FLAG: | DMA1 channel 5 half transfer complete flag |
| DMA1_DTERR5_FLAG: | DMA1 channel 5 transfer error flag |
| DMA1_GL6_FLAG: | DMA1 channel 6 global flag |
| DMA1_FDT6_FLAG: | DMA1 channel 6 transfer complete flag |
| DMA1_HDT6_FLAG: | DMA1 channel 6 half transfer complete flag |
| DMA1_DTERR6_FLAG: | DMA1 channel 6 transfer error flag |
| DMA1_GL7_FLAG: | DMA1 channel 7 global flag |
| DMA1_FDT7_FLAG: | DMA1 channel 7 transfer complete flag |
| DMA1_HDT7_FLAG: | DMA1 channel 7 half transfer complete flag |
| DMA1_DTERR7_FLAG: | DMA1 channel 7 transfer error flag |
| DMA2_GL1_FLAG: | DMA2 channel 1 global flag |
| DMA2_FDT1_FLAG: | DMA2 channel 1 transfer complete flag |
| DMA2_HDT1_FLAG: | DMA2 channel 1 half transfer complete flag |

| | |
|-------------------|--|
| DMA2_DTERR1_FLAG: | DMA2 channel 1 transfer error flag |
| DMA2_GL2_FLAG: | DMA2 channel 2 global flag |
| DMA2_FDT2_FLAG: | DMA2 channel 2 transfer complete flag |
| DMA2_HDT2_FLAG: | DMA2 channel 2 half transfer complete flag |
| DMA2_DTERR2_FLAG: | DMA2 channel 2 transfer error flag |
| DMA2_GL3_FLAG: | DMA2 channel 3 global flag |
| DMA2_FDT3_FLAG: | DMA2 channel 3 transfer complete flag |
| DMA2_HDT3_FLAG: | DMA2 channel 3 half transfer complete flag |
| DMA2_DTERR3_FLAG: | DMA2 channel 3 transfer error flag |
| DMA2_GL4_FLAG: | DMA2 channel 4 global flag |
| DMA2_FDT4_FLAG: | DMA2 channel 4 transfer complete flag |
| DMA2_HDT4_FLAG: | DMA2 channel 4 half transfer complete flag |
| DMA2_DTERR4_FLAG: | DMA2 channel 4 transfer error flag |
| DMA2_GL5_FLAG: | DMA2 channel 5 global flag |
| DMA2_FDT5_FLAG: | DMA2 channel 5 transfer complete flag |
| DMA2_HDT5_FLAG: | DMA2 channel 5 half transfer complete flag |
| DMA2_DTERR5_FLAG: | DMA2 channel 5 transfer error flag |
| DMA2_GL6_FLAG: | DMA2 channel 6 global flag |
| DMA2_FDT6_FLAG: | DMA2 channel 6 transfer complete flag |
| DMA2_HDT6_FLAG: | DMA2 channel 6 half transfer complete flag |
| DMA2_DTERR6_FLAG: | DMA2 channel 6 transfer error flag |
| DMA2_GL7_FLAG: | DMA2 channel 7 global flag |
| DMA2_FDT7_FLAG: | DMA2 channel 7 transfer complete flag |
| DMA2_HDT7_FLAG: | DMA2 channel 7 half transfer complete flag |
| DMA2_DTERR7_FLAG: | DMA2 channel 7 transfer error flag |

flag_status

RESET: Flag is reset

SET: Flag is set

Example:

```
if(dma_flag_get(DMA2_FDT1_FLAG) != RESET)
{
    /* turn led2/led3/led4 on */
    at32_led_on(LED2);
    at32_led_on(LED3);
    at32_led_on(LED4);
}
```

5.8.10 dma_flag_clear function

The table below describes the function `dma_flag_clear`.

Table 163. `dma_flag_clear` function

| Name | Description |
|------------------------|---|
| Function name | <code>dma_flag_clear</code> |
| Function prototype | <code>void dma_flag_clear(uint32_t dmax_flag);</code> |
| Function description | Clear the selected flag |
| Input parameter 1 | <i>dmax_flag</i> : a flag that needs to be cleared |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

dmax_flag

The `dmax_flag` is used to select the desired flag, including:

| | |
|-------------------|--|
| DMA1_GL1_FLAG: | DMA1 channel 1 global flag |
| DMA1_FDT1_FLAG: | DMA1 channel 1 transfer complete flag |
| DMA1_HDT1_FLAG: | DMA1 channel 1 half transfer complete flag |
| DMA1_DTERR1_FLAG: | DMA1 channel 1 transfer error flag |
| DMA1_GL2_FLAG: | DMA1 channel 2 global flag |
| DMA1_FDT2_FLAG: | DMA1 channel 2 transfer complete flag |
| DMA1_HDT2_FLAG: | DMA1 channel 2 half transfer complete flag |
| DMA1_DTERR2_FLAG: | DMA1 channel 2 transfer error flag |
| DMA1_GL3_FLAG: | DMA1 channel 3 global flag |
| DMA1_FDT3_FLAG: | DMA1 channel 3 transfer complete flag |
| DMA1_HDT3_FLAG: | DMA1 channel 3 half transfer complete flag |
| DMA1_DTERR3_FLAG: | DMA1 channel 3 transfer error flag |
| DMA1_GL4_FLAG: | DMA1 channel 4 global flag |
| DMA1_FDT4_FLAG: | DMA1 channel 4 transfer complete flag |
| DMA1_HDT4_FLAG: | DMA1 channel 4 half transfer complete flag |
| DMA1_DTERR4_FLAG: | DMA1 channel 4 transfer error flag |
| DMA1_GL5_FLAG: | DMA1 channel 5 global flag |
| DMA1_FDT5_FLAG: | DMA1 channel 5 transfer complete flag |
| DMA1_HDT5_FLAG: | DMA1 channel 5 half transfer complete flag |
| DMA1_DTERR5_FLAG: | DMA1 channel 5 transfer error flag |
| DMA1_GL6_FLAG: | DMA1 channel 6 global flag |
| DMA1_FDT6_FLAG: | DMA1 channel 6 transfer complete flag |
| DMA1_HDT6_FLAG: | DMA1 channel 6 half transfer complete flag |
| DMA1_DTERR6_FLAG: | DMA1 channel 6 transfer error flag |
| DMA1_GL7_FLAG: | DMA1 channel 7 global flag |
| DMA1_FDT7_FLAG: | DMA1 channel 7 transfer complete flag |
| DMA1_HDT7_FLAG: | DMA1 channel 7 half transfer complete flag |
| DMA1_DTERR7_FLAG: | DMA1 channel 7 transfer error flag |
| DMA2_GL1_FLAG: | DMA2 channel 1 global flag |
| DMA2_FDT1_FLAG: | DMA2 channel 1 transfer complete flag |
| DMA2_HDT1_FLAG: | DMA2 channel 1 half transfer complete flag |

| | |
|-------------------|--|
| DMA2_DTERR1_FLAG: | DMA2 channel 1 transfer error flag |
| DMA2_GL2_FLAG: | DMA2 channel 2 global flag |
| DMA2_FDT2_FLAG: | DMA2 channel 2 transfer complete flag |
| DMA2_HDT2_FLAG: | DMA2 channel 2 half transfer complete flag |
| DMA2_DTERR2_FLAG: | DMA2 channel 2 transfer error flag |
| DMA2_GL3_FLAG: | DMA2 channel 3 global flag |
| DMA2_FDT3_FLAG: | DMA2 channel 3 transfer complete flag |
| DMA2_HDT3_FLAG: | DMA2 channel 3 half transfer complete flag |
| DMA2_DTERR3_FLAG: | DMA2 channel 3 transfer error flag |
| DMA2_GL4_FLAG: | DMA2 channel 4 global flag |
| DMA2_FDT4_FLAG: | DMA2 channel 4 transfer complete flag |
| DMA2_HDT4_FLAG: | DMA2 channel 4 half transfer complete flag |
| DMA2_DTERR4_FLAG: | DMA2 channel 4 transfer error flag |
| DMA2_GL5_FLAG: | DMA2 channel 5 global flag |
| DMA2_FDT5_FLAG: | DMA2 channel 5 transfer complete flag |
| DMA2_HDT5_FLAG: | DMA2 channel 5 half transfer complete flag |
| DMA2_DTERR5_FLAG: | DMA2 channel 5 transfer error flag |
| DMA2_GL6_FLAG: | DMA2 channel 6 global flag |
| DMA2_FDT6_FLAG: | DMA2 channel 6 transfer complete flag |
| DMA2_HDT6_FLAG: | DMA2 channel 6 half transfer complete flag |
| DMA2_DTERR6_FLAG: | DMA2 channel 6 transfer error flag |
| DMA2_GL7_FLAG: | DMA2 channel 7 global flag |
| DMA2_FDT7_FLAG: | DMA2 channel 7 transfer complete flag |
| DMA2_HDT7_FLAG: | DMA2 channel 7 half transfer complete flag |
| DMA2_DTERR7_FLAG: | DMA2 channel 7 transfer error flag |

Example:

```
if(dma_flag_get(DMA2_FDT1_FLAG) != RESET)
{
    /* turn led2/led3/led4 on */
    at32_led_on(LED2);
    at32_led_on(LED3);
    at32_led_on(LED4);
    dma_flag_clear(DMA2_FDT1_FLAG);
}
```

5.9 External interrupt/event controller (EXINT)

The EXINT register structure exint_type is defined in the “at32f413_exint.h”.

```
/**
 * @brief type define exint register all
 */
typedef struct
{
    ...
} exint_type;
```

The table below gives a list of the EXINT registers.

Table 164. Summary of EXINT registers

| Register | Description |
|----------|-----------------------------------|
| inten | Interrupt enable register |
| evten | Event enable register |
| polcfg1 | Polarity configuration register 1 |
| polcfg2 | Polarity configuration register 2 |
| swtrg | Software trigger register |
| intsts | Interrupt status register |

The table below gives a list of the EXINT library functions.

Table 165. Summary of EXINT library functions

| Function name | Description |
|---|--|
| exint_reset | Reset all EXINT registers to their reset values |
| exint_default_para_init | Configure the EXINT initial structure with the initial value |
| exint_init | Initialize EXINT |
| exint_flag_clear | Clear the selected EXINT interrupt flag |
| exint_flag_get | Read the selected EXINT interrupt flag |
| exint_software_interrupt_event_generate | Software interrupt event generation |
| exint_interrupt_enable | Enable the selected EXINT interrupt |
| exint_event_enable | Enable the selected EXINT event |

5.9.1 exint_reset function

The table below describes the function exint_reset.

Table 166. exint_reset function

| Name | Description |
|------------------------|---|
| Function name | exint_reset |
| Function prototype | void exint_reset(void); |
| Function description | Reset all EXINT registers to their reset values |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
exint_reset();
```

5.9.2 exint_default_para_init function

The table below describes the function exint_default_para_init.

Table 167. exint_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | exint_default_para_init |
| Function prototype | void exint_default_para_init(exint_init_type *exint_struct); |
| Function description | Configure the EXINT initial structure with the initial value |
| Input parameter 1 | exint_struct: exint_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of exint_init_type before starting. |
| Called functions | NA |

Example:

```
exint_init_type exint_init_struct;  
exint_default_para_init(&exint_init_struct);
```

5.9.3 exint_init function

The table below describes the function exint_init.

Table 168. exint_init function

| Name | Description |
|------------------------|--|
| Function name | exint_init |
| Function prototype | void exint_init(exint_init_type *exint_struct); |
| Function description | Initialize EXINT |
| Input parameter 1 | exint_init_type : exint_init_struct pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of exint_init_type before starting. |
| Called functions | NA |

The exint_init_type is defined in the at32f413_exint.h.

typedef struct

```
{
    exint_line_mode_type      line_mode;
    uint32_t                  line_select;
    exint_polarity_config_type line_polarity;
    confirm_state              line_enable;
} exint_init_type;
```

line_mode

Select event mode or interrupt mode

EXINT_LINE_INTERRUPT: Interrupt mode

EXINT_LINE_EVENT: Event mode

line_select

Line selection

EXINT_LINE_NONE: No line

EXINT_LINE_0: line0

EXINT_LINE_1: line1

...

EXINT_LINE_18: line18

line_polarity

Trigger edge selection

EXINT_TRIGGER_RISING_EDGE: Rising edge

EXINT_TRIGGER_FALLING_EDGE: Falling edge

EXINT_TRIGGER_BOTH_EDGE: Rising/falling edge

line_enable

Enable/disable line

FALSE: Disable line

TRUE: Enable line

Example:

```
exint_init_type exint_init_struct;
exint_default_para_init(&exint_init_struct);
```

```

exint_init_struct.line_enable = TRUE;
exint_init_struct.line_mode = EXINT_LINE_INTERRUPT;
exint_init_struct.line_select = EXINT_LINE_0;
exint_init_struct.line_polarity = EXINT_TRIGGER_RISING_EDGE;
exint_init(&exint_init_struct);

```

5.9.4 exint_flag_clear function

The table below describes the function exint_flag_clear.

Table 169. exint_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | exint_flag_clear |
| Function prototype | void exint_flag_clear(uint32_t exint_line); |
| Function description | Clear the selected EXINT interrupt flag |
| Input parameter | exint_line: line selection Refer to line_select for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
exint_flag_clear(EXINT_LINE_0);
```

5.9.5 exint_flag_get function

The table below describes the function exint_flag_get.

Table 170. exint_flag_get function

| Name | Description |
|------------------------|---|
| Function name | exint_flag_get |
| Function prototype | flag_status exint_flag_get(uint32_t exint_line); |
| Function description | Get the selected EXINT interrupt flag |
| Input parameter | exint_line: line selection Refer to the line_select for details. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of the selected flag This parameter can be SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

flag_status status = RESET;
status = exint_flag_get(EXINT_LINE_0);

```

5.9.6 exint_interrupt_flag_get function

The table below describes the function exint_interrupt_flag_get.

Table 171. exint_interrupt_flag_get function

| Name | Description |
|------------------------|---|
| Function name | exint_interrupt_flag_get |
| Function prototype | flag_status exint_interrupt_flag_get(uint32_t exint_line) |
| Function description | Get the selected EXINT interrupt flag |
| Input parameter | exint_line: line selection Refer to the line_select for details. |
| Output parameter | NA |
| Return value | flag_status: indicates the status of the selected flag This parameter can be SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example

```
flag_status status = RESET;
status = exint_interrupt_flag_get (EXINT_LINE_0);
```

5.9.7 exint_software_interrupt_event_generate function

The table below describes the function exint_software_interrupt_event_generate.

Table 172. exint_software_interrupt_event_generate function

| Name | Description |
|------------------------|---|
| Function name | exint_software_interrupt_event_generate |
| Function prototype | void exint_software_interrupt_event_generate(uint32_t exint_line); |
| Function description | Generate software interrupt event |
| Input parameter | exint_line: line selection Refer to the line_select for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
exint_software_interrupt_event_generate (EXINT_LINE_0);
```

5.9.8 exint_interrupt_enable function

The table below describes the function exint_interrupt_enable.

Table 173. exint_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | exint_interrupt_enable |
| Function prototype | void exint_interrupt_enable(uint32_t exint_line, confirm_state new_state); |
| Function description | Enable the selected EXINT interrupt |
| Input parameter 1 | exint_line: line selection Refer to the line_select for details. |
| Input parameter 2 | new_state: enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
exint_interrupt_enable (EXINT_LINE_0);
```

5.9.9 exint_event_enable function

The table below describes the function exint_event_enable.

Table 174. exint_event_enable function

| Name | Description |
|------------------------|---|
| Function name | exint_event_enable |
| Function prototype | void exint_event_enable(uint32_t exint_line, confirm_state new_state); |
| Function description | Enable the selected EXINT event |
| Input parameter 1 | exint_line: line selection Refer to the line_select for details. |
| Input parameter 2 | new_state: enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
exint_event_enable (EXINT_LINE_0);
```

5.10 Flash memory controller (FLASH)

The FLASH register structure flash_type is defined in the “at32f413_flash.h”.

```
/**  
 * @brief type define flash register all  
 */  
  
typedef struct  
{  
    ...  
} flash_type;
```

The table below gives a list of the FLASH registers.

Table 175. Summary of FLASH registers

| Register | Description |
|------------------|--|
| flash_psr | Flash performance select register |
| flash_unlock | Flash unlock register |
| flash_usd_unlock | Flash user system data unlock register |
| flash_sts | Flash status register |
| flash_ctrl | Flash control register |
| flash_addr | Flash address register |
| flash_usd | User system data register |
| flash_epps | Erase/program protection status register |
| flash_unlock3 | Flash unlock register 3 |
| flash_select | Flash select register |
| flash_sts3 | Flash status register 3 |
| flash_ctrl3 | Flash control register 3 |
| flash_addr3 | Flash address register 3 |
| flash_da | Flash decryption address register |
| slib_sts0 | Flash security library status register 0 |
| slib_sts1 | Flash security library status register 1 |
| slib_pwd_clr | Flash security library password clear register |
| slib_misc_sts | Security library additional status register |
| slib_set_pwd | Security library password setting register |
| slib_set_range | Security library address setting register |
| slib_unlock | Security library unlock register |
| flash_crc_ctrl | Flash CRC check control register |
| flash_crc_chkr | Flash CRC check result register |

The table below gives a list of the FLASH library functions.

Table 176. Summary of FLASH library functions

| Function name | Description |
|---------------------------------|--|
| flash_flag_get | Get flag status |
| flash_flag_clear | Clear flag |
| flash_operation_status_get | Get operation status (Flash memory) |
| flash_spim_operation_status_get | Get operation status (external memory) |
| flash_operation_wait_for | Wait for operation complete (Flash memory) |
| flash_spim_operation_wait_for | Wait for operation complete (external memory) |
| flash_unlock | Unlock flash memory |
| flash_spim_unlock | Unlock external memory |
| flash_lock | Lock flash memory bank |
| flash_spim_lock | Lock external memory |
| flash_sector_erase | Erase Flash sector |
| flash_internal_all_erase | Erase internal Flash memory |
| flash_spim_all_erase | Erase external memory |
| flash_user_system_data_erase | Erase user system data |
| flash_word_program | Flash word programming |
| flash_halfword_program | Flash half-word programming |
| flash_byte_program | Flash byte programming |
| flash_user_system_data_program | User system data programming |
| flash_epp_set | Erase/programming protection configuration |
| flash_epp_status_get | Get erase/programming protection status |
| flash_fap_enable | Configure Flash access protection |
| flash_fap_status_get | Get Flash access protection status |
| flash(ssb)_set | System configuration byte configuration |
| flash(ssb)_status_get | Get system configuration byte configuration status |
| flash_interrupt_enable | Flash interrupt configuration |
| flash_spim_model_select | Select external memory model |
| flash_spim_encryption_range_set | Configure external memory encryption range |
| flash_slib_enable | Enable security library |
| flash_slib_disable | Disable security library |
| flash_slib_remaining_count_get | Get sLib remaining count |
| flash_slib_state_get | Get sLib status |
| flash_slib_start_sector_get | Get sLib start sector |
| flash_slib_datastart_sector_get | Get sLib data start sector |
| flash_slib_end_sector_get | Get sLib end sector |
| flash_crc_calibrate | Flash CRC verify |

5.10.1 flash_flag_get function

The table below describes the function flash_flag_get.

Table 177. flash_flag_get function

| Name | Description |
|------------------------|--|
| Function name | flash_flag_get |
| Function prototype | flag_status flash_flag_get(uint32_t flash_flag); |
| Function description | Get flag status |
| Input parameter | flash_flag: flag selection |
| Output parameter | NA |
| Return value | flag_status: indicates the flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flash_flag

Flag selection

| | |
|-------------------------|------------------------------------|
| FLASH_OBF_FLAG: | Flash operation busy |
| FLASH_ODF_FLAG: | Flash operation complete |
| FLASH_PGMERR_FLAG: | Flash programming error |
| FLASH_EPPERR_FLAG: | Flash erase error |
| FLASH_SPIM_OBF_FLAG: | External memory operation busy |
| FLASH_SPIM_ODF_FLAG: | External memory operation complete |
| FLASH_SPIM_PGMERR_FLAG: | External memory programming error |
| FLASH_SPIM_EPPERR_FLAG: | External memory erase error |
| FLASH_USDERR_FLAG: | User system data area error |

Example:

```
flag_status status;
status = flash_flag_get(FLASH_ODF_FLAG);
```

5.10.2 flash_flag_clear function

The table below describes the function flash_flag_clear.

Table 178. flash_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | flash_flag_clear |
| Function prototype | void flash_flag_clear(uint32_t flash_flag); |
| Function description | Clear flag |
| Input parameter | flash_flag: flag selection |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flash_flag

Flag selection

| | |
|-----------------|--------------------------|
| FLASH_ODF_FLAG: | Flash operation complete |
|-----------------|--------------------------|

| | |
|---------------------------|------------------------------------|
| FLASH_PRGMERR_FLAG: | Flash programming error |
| FLASH_EPPERR_FLAG: | Flash erase error |
| FLASH_SPI_M_ODF_FLAG: | External memory operation complete |
| FLASH_SPI_M_PRGMERR_FLAG: | External memory programming error |
| FLASH_SPI_M_EPPERR_FLAG: | External memory erase error |

Example:

```
flash_flag_clear(FLASH_ODF_FLAG);
```

5.10.3 flash_operation_status_get function

The table below describes the function `flash_operation_status_get`

Table 179. `flash_operation_status_get` function

| Name | Description |
|------------------------|---|
| Function name | <code>flash_operation_status_get</code> |
| Function prototype | <code>flash_status_type flash_operation_status_get(void);</code> |
| Function description | Get Flash operation status |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Operation status Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

`flash_status_type`

| | |
|------------------------|--------------------------------|
| FLASH_OPERATE_BUSY: | Operate busy |
| FLASH_PROGRAM_ERROR: | Programming error |
| FLASH_EPP_ERROR: | Erase/program protection error |
| FLASH_OPERATE_DONE: | Flash operation complete |
| FLASH_OPERATE_TIMEOUT: | Flash operation timeout |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;  
/* check for the flash status */  
status = flash_operation_status_get();
```

5.10.4 flash_spim_operation_status_get function

The table below describes the function flash_spim_operation_status_get.

Table 180. flash_spim_operation_status_get function

| Name | Description |
|------------------------|---|
| Function name | flash_spim_operation_status_get |
| Function prototype | flash_status_type flash_spim_operation_status_get (void); |
| Function description | Get external memory operation status |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Operation status Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
/* check for the flash status */
status = flash_spim_operation_status_get();
```

5.10.5 flash_operation_wait_for function

The table below describes the function flash_operation_wait_for.

Table 181. flash_operation_wait_for function

| Name | Description |
|------------------------|--|
| Function name | flash_operation_wait_for |
| Function prototype | flash_status_type flash_operation_wait_for(uint32_t time_out); |
| Function description | Wait for Flash operation |
| Input parameter | time_out: wait timeout The wait timeout value is defined in the flash.h file; refer to flash_time_out . |
| Output parameter | NA |
| Return value | Operation status Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

flash_time_out

| | |
|---------------------------|-------------------------------------|
| ERASE_TIMEOUT: | Erase timeout |
| PROGRAMMING_TIMEOUT: | Programming timeout |
| SPIM_ERASE_TIMEOUT: | External memory erase timeout |
| SPIM_PROGRAMMING_TIMEOUT: | External memory programming timeout |
| OPERATION_TIMEOUT: | General operation timeout |

Example:

```
/* wait for operation to be completed */
status = flash_operation_wait_for(PROGRAMMING_TIMEOUT);
```

5.10.6 flash_spim_operation_wait_for function

The table below describes the function flash_spim_operation_wait_for.

Table 182. flash_spim_operation_wait_for function

| Name | Description |
|------------------------|---|
| Function name | flash_spim_operation_wait_for |
| Function prototype | flash_status_type flash_spim_operation_wait_for(uint32_t time_out); |
| Function description | Wait for external memory operation |
| Input parameter | time_out: wait timeout The timeout value is defined in the flash.h file; refer to flash_time_out . |
| Output parameter | NA |
| Return value | Operation status Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* wait for operation to be completed */
status = flash_spim_operation_wait_for(PROGRAMMING_TIMEOUT);
```

5.10.7 flash_unlock function

The table below describes the function flash_unlock.

Table 183. flash_unlock function

| Name | Description |
|------------------------|--------------------------------|
| Function name | flash_unlock |
| Function prototype | void flash_unlock(void); |
| Function description | Unlock Flash memory controller |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_unlock();
```

5.10.8 flash_spim_unlock function

The table below describes the function flash_spim_unlock

Table 184. flash_spim_unlock function

| Name | Description |
|------------------------|-----------------------------------|
| Function name | flash_spim_unlock |
| Function prototype | void flash_spim_unlock(void); |
| Function description | Unlock external memory controller |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_spim_unlock();
```

5.10.9 flash_lock function

The table below describes the function flash_lock.

Table 185. flash_lock function

| Name | Description |
|------------------------|------------------------------|
| Function name | flash_lock |
| Function prototype | void flash_lock(void); |
| Function description | Lock Flash memory controller |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_lock();
```

5.10.10 flash_spim_lock function

The table below describes the function flash_spim_lock.

Table 186. flash_spim_lock function

| Name | Description |
|------------------------|---------------------------------|
| Function name | flash_spim_lock |
| Function prototype | void flash_spim_lock(void); |
| Function description | Lock external memory controller |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_spim_lock();
```

5.10.11 flash_sector_erase function

The table below describes the function flash_sector_erase.

Table 187. flash_sector_erase function

| Name | Description |
|------------------------|--|
| Function name | flash_sector_erase |
| Function prototype | flash_status_type flash_sector_erase(uint32_t sector_address); |
| Function description | Erase data in the selected Flash sector address |
| Input parameter | sector_address: select the Flash sector address to be erased, usually Flash sector start address |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;  
flash_unlock();  
status = flash_sector_erase(0x08001000);
```

5.10.12 flash_internal_all_erase function

The table below describes the function flash_internal_all_erase.

Table 188. flash_internal_all_erase function

| Name | Description |
|------------------------|---|
| Function name | flash_internal_all_erase |
| Function prototype | flash_status_type flash_internal_all_erase(void); |
| Function description | Erase internal Flash data |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;  
flash_unlock();  
status = flash_internal_all_erase();
```

5.10.13 flash_spim_all_erase function

The table below describes the function flash_spim_all_erase.

Table 189. flash_spim_all_erase function

| Name | Description |
|------------------------|---|
| Function name | flash_spim_all_erase |
| Function prototype | flash_status_type flash_spim_all_erase(void); |
| Function description | Erase external memory data |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;  
flash_spim_unlock();  
status = flash_spim_all_erase();
```

5.10.14 flash_user_system_data_erase function

The table below describes the function `flash_user_system_data_erase`.

Table 190. `flash_user_system_data_erase` function

| Name | Description |
|------------------------|--|
| Function name | <code>flash_user_system_data_erase</code> |
| Function prototype | <code>flash_status_type flash_user_system_data_erase(void);</code> |
| Function description | Erase user system data |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Note: As this function remains in FAP state, it only erases data except FAP in the user system data area.

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
flash_unlock();
status = flash_user_system_data_erase();
```

5.10.15 flash_word_program function

The table below describes the function `flash_word_program`

Table 191. `flash_word_program` function

| Name | Description |
|------------------------|--|
| Function name | <code>flash_word_program</code> |
| Function prototype | <code>flash_status_type flash_word_program(uint32_t address, uint32_t data);</code> |
| Function description | Write one word data to a given address |
| Input parameter 1 | address: programmed address, word-aligned |
| Input parameter 2 | data: programmed data |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | The programming operation can be allowed only when data in the address are all 0xFF. |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
uint32_t i;
flash_unlock();
status = flash_sector_erase(0x08001000);
if(status = FLASH_OPERATE_DONE)
{
    /* program 256 words */
    for(i = 0; i < 256; i++)
    {
        status = flash_word_program(0x08001000 + i*4, i);
```

{
}

5.10.16 flash_halfword_program function

The table below describes the function flash_halfword_program.

Table 192. flash_halfword_program function

| Name | Description |
|------------------------|--|
| Function name | flash_halfword_program |
| Function prototype | flash_status_type flash_halfword_program(uint32_t address, uint16_t data); |
| Function description | Write a half-word data to a given address |
| Input parameter 1 | address: programmed address, half-word-aligned |
| Input parameter 2 | data: programmed data |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | The programming operation can be allowed only when data in the address are all 0xFF. |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;  
uint32_t i;  
flash_unlock();  
status = flash_sector_erase(0x08001000);  
if(status = FLASH_OPERATE_DONE)  
{  
    /* program 256 halfwords */  
    for(l = 0; l < 256; i++)  
    {  
        status = flash_halfword_program(0x08001000 + i*2, (uint16_t)i);  
    }  
}
```

5.10.17 flash_byte_program function

The table below describes the function flash_byte_program.

Table 193. flash_byte_program function

| Name | Description |
|------------------------|--|
| Function name | flash_byte_program |
| Function prototype | flash_status_type flash_byte_program(uint32_t address, uint8_t data); |
| Function description | Program a byte data to a given address |
| Input parameter 1 | address: programmed address |
| Input parameter 2 | data: programmed data |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | The programming operation can be allowed only when data in the address are all 0xFF. |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
uint32_t i;
flash_unlock();
status = flash_sector_erase(0x08001000);
if(status = FLASH_OPERATE_DONE)
{
    /* program 256 bytes */
    for(i = 0; i < 256; i++)
    {
        status = flash_byte_program(0x08001000 + i*2, (uint8_t)i);
    }
}
```

5.10.18 flash_user_system_data_program function

The table below describes the function flash_user_system_data_program.

Table 194. flash_user_system_data_program function

| Name | Description |
|------------------------|---|
| Function name | flash_user_system_data_program |
| Function prototype | flash_status_type flash_user_system_data_program (uint32_t address, uint8_t data); |
| Function description | Program a byte data to a given address in the user system data area |
| Input parameter 1 | address: programmed address |
| Input parameter 2 | data: programmed data |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | The programming operation can be allowed only when data and its inverse data in the user system data area are all 0xFF. |
| Called functions | NA |

Example:

```

flash_status_type status = FLASH_OPERATE_DONE;
flash_unlock();
status = flash_user_system_data_erase();
if(status = FLASH_OPERATE_DONE)
{
    /* program user system data */
    status = flash_user_system_data_program(0x1FFF804, 0x55);
}

```

5.10.19 flash_epp_set function

The table below describes the function `flash_epp_set`.

Table 195. `flash_epp_set` function

| Name | Description |
|------------------------|--|
| Function name | <code>flash_epp_set</code> |
| Function prototype | <code>flash_status_type flash_epp_set(uint32_t *sector_bits);</code> |
| Function description | Enable erase programming protection |
| Input parameter | *sector_bits: Erase programming protection sector address pointer. Each bit protects 4 KB sectors, and the last bit protects the remaining sectors. Setting this bit to 1 enables sector protection. |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

flash_status_type status = FLASH_OPERATE_DONE;
uint32_t epp_val;
flash_unlock();
status = flash_user_system_data_erase();
if(status = FLASH_OPERATE_DONE)
{
    epp_val = 0x00000001;
    /* program epp */
    status = flash_epp_set(&epp_val);
}

```

5.10.20 flash_epp_status_get function

The table below describes the function flash_epp_status_get.

Table 196. flash_epp_status_get function

| Name | Description |
|------------------------|---|
| Function name | flash_epp_status_get |
| Function prototype | void flash_epp_status_get(uint32_t *sector_bits); |
| Function description | Get the status of erase programming protection |
| Input parameter | NA |
| Output parameter | *sector_bits: Erase programming protection sector address pointer. Each bit protects 4KB sectors, and the last bit protects the remaining sectors. Setting this bit to 1 enables sector protection. |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t epp_val;
/* get epp status */
flash_epp_status_get(&epp_val);
```

5.10.21 flash_fap_enable function

The table below describes the function flash_fap_enable.

Table 197. flash_fap_enable function

| Name | Description |
|------------------------|---|
| Function name | flash_fap_enable |
| Function prototype | flash_status_type flash_fap_enable(confirm_state new_state); |
| Function description | Enable Flash access protection |
| Input parameter | new_state: Flash access protection status This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Note: This function will erase the whole user system data area. If there were data programmed in the user system data area before calling this function, they have to be re-programmed after calling this function.

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
flash_unlock();
status = flash_fap_enable(TRUE);
```

5.10.22 flash_fap_status_get function

The table below describes the function flash_fap_status_get.

Table 198. flash_fap_status_get function

| Name | Description |
|------------------------|---|
| Function name | flash_fap_status_get |
| Function prototype | flag_status flash_fap_status_get(void); |
| Function description | Get the status of Flash access protection |
| Input parameter | NA |
| Output parameter | NA |
| Return value | flag_status: flag status This parameter can be SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flag_status status;
status = flash_fap_status_get();
```

5.10.23 flash(ssb) set function

The table below describes the function flash(ssb) set.

Table 199. flash(ssb) set function

| Name | Description |
|------------------------|--|
| Function name | flash_ssbs_set |
| Function prototype | flash_status_type flash_ssbs_set(uint8_t usd_ssbs); |
| Function description | Configure system setting bytes |
| Input parameter | usd_ssbs: system setting byte value is a combination of the selected data from all data group; refer to ssb_data_define for details. |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

ssb_data_define

type 1:

| | |
|----------------------|------------------------------|
| USD_WDT_ATO_DISABLE: | Watchdog auto-start disabled |
| USD_WDT_ATO_ENABLE: | Watchdog auto-start enabled |

type 2:

| | |
|--------------------|--|
| USD_DEPSLP_NO_RST: | No reset occurs when entering Deepsleep mode |
| USD_DEPSLP_RST: | Reset occurs when entering Deepsleep mode |

type 3:

| | |
|-------------------|--|
| USD_STDBY_NO_RST: | No reset occurs when entering Standby mode |
| USD_STDBY_RST: | Reset occurs when entering Standby mode |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
flash_unlock();
```

```

status = flash_user_system_data_erase();
if(status == FLASH_OPERATE_DONE)
{
    status = flash(ssb_set(USD_WDT_ATO_DISABLE | USD_DEPSLP_NO_RST | USD_STDBY_RST);
}

```

5.10.24 flash_ssbb_status_get function

The table below describes the function flash_ssbb_status_get.

Table 200. flash_ssbb_status_get function

| Name | Description |
|------------------------|---|
| Function name | flash_ssbb_status_get |
| Function prototype | uint8_t flash_ssbb_status_get(void); |
| Function description | Get the status of system setting bytes |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return system setting byte value. Refer to ssbb_data_define for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

uint8_t ssbb_val;
ssbb_val = flash_ssbb_status_get();

```

5.10.25 flash_interrupt_enable function

The table below describes the function flash_interrupt_enable.

Table 201. flash_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | flash_interrupt_enable |
| Function prototype | void flash_interrupt_enable(uint32_t flash_int, confirm_state new_state); |
| Function description | Enable Flash interrupts |
| Input parameter 1 | flash_int: Flash interrupt type. Refer to flash_interrupt_type for details. |
| Input parameter 2 | new_state: interrupt status This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flash_interrupt_type

- | | |
|---------------------|------------------------------------|
| FLASH_ERR_INT: | Flash error interrupt |
| FLASH_ODF_INT: | Flash operation complete interrupt |
| FLASH_SPIM_ERR_INT: | External memory error interrupt |

FLASH_SPIM_ODF_INT: External memory operation complete interrupt

Example:

```
flash_interrupt_enable(FLASH_ERR_INT | FLASH_ODF_INT, TRUE);
```

5.10.26 flash_spim_model_select function

The table below describes the function `flash_spim_model_select`.

Table 202. `flash_spim_model_select` function

| Name | Description |
|------------------------|---|
| Function name | <code>flash_spim_model_select</code> |
| Function prototype | <code>void flash_spim_model_select(flash_spim_model_type mode);</code> |
| Function description | Select external memory type |
| Input parameter | mode: external memory type; refer to <code>flash_spim_mode_type</code> for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

`flash_spim_mode_type`

FLASH_SPIM_MODEL1: Model 1

FLASH_SPIM_MODEL2: Model 2

Example:

```
flash_spim_model_select(FLASH_SPIM_MODEL1);
```

5.10.27 flash_spim_encryption_range_set function

The table below describes the function `flash_spim_encryption_range_set`.

Table 203. `flash_spim_encryption_range_set` function

| Name | Description |
|------------------------|---|
| Function name | <code>flash_spim_encryption_range_set</code> |
| Function prototype | <code>void flash_spim_encryption_range_set(uint32_t decode_address);</code> |
| Function description | Set external memory data encryption range |
| Input parameter | decode_address: encryption address, word-aligned; data before this address is in ciphertext |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_spim_encryption_range_set(0x08401000);
```

5.10.28 flash_slib_enable function

The table below describes the function flash_slib_enable.

Table 204. flash_slib_enable function

| Name | Description |
|------------------------|--|
| Function name | flash_slib_enable |
| Function prototype | flash_status_type flash_slib_enable(uint32_t pwd, uint16_t start_sector, uint16_t data_start_sector, uint16_t end_sector); |
| Function description | Enable security library (sLib) and its address range |
| Input parameter 1 | pwd: The sLib data are saved as ciphertext, associated with encrypted computing. A correct password is entered in order to unlock encryption. |
| Input parameter 2 | start_sector: sLib start sector number |
| Input parameter 3 | data_start_sector: sLib data area instruction start sector number |
| Input parameter 4 | end_sector: sLib end sector number |
| Output parameter | NA |
| Return value | Refer to flash_status_type for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flash_status_type status = FLASH_OPERATE_DONE;
status = flash_slib_enable(0x12345678, 0x04 , 0x05, 0x06);
```

5.10.29 flash_slib_disable function

The table below describes the function flash_slib_disable.

Table 205. flash_slib_disable function

| Name | Description |
|------------------------|---|
| Function name | flash_slib_disable |
| Function prototype | error_status flash_slib_disable(uint32_t pwd); |
| Function description | Disable security library (sLib) |
| Input parameter | pwd: sLib password. it must be entered correctly, otherwise it is not allowed to enter until reset. |
| Output parameter | NA |
| Return value | Return error status This parameter can be ERROE or SUCCESS. |
| Required preconditions | NA |
| Called functions | NA |

Note: Successful calling of this function will erase the whole internal Flash memory.

Example:

```
error_status status;
status = flash_slib_disable(0x12345678);
```

5.10.30 flash_slib_remaining_count_get function

The table below describes the function flash_slib_remaining_count_get.

Table 206. flash_slib_remaining_count_get function

| Name | Description |
|------------------------|--|
| Function name | flash_slib_remaining_count_get |
| Function prototype | uint32_t flash_slib_remaining_count_get(void); |
| Function description | Get the sLib remaining count |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return the sLib remaining count |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t num;
num = flash_slib_remaining_count_get();
```

5.10.31 flash_slib_state_get function

The table below describes the function flash_slib_state_get.

Table 207. flash_slib_state_get function

| Name | Description |
|------------------------|---|
| Function name | flash_slib_state_get |
| Function prototype | flag_status flash_slib_state_get(void); |
| Function description | Get the status of sLib |
| Input parameter | NA |
| Output parameter | NA |
| Return value | flag_status: flag status This parameter can be SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
flag_status status;
status = flash_slib_state_get();
```

5.10.32 flash_slib_start_sector_get function

The table below describes the function flash_slib_start_sector_get.

Table 208. flash_slib_start_sector_get function

| Name | Description |
|------------------------|---|
| Function name | flash_slib_start_sector_get |
| Function prototype | uint16_t flash_slib_start_sector_get(void); |
| Function description | Get the start sector number of sLib |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return the start sector number of sLib |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint16_t num;  
num = flash_slib_start_sector_get();
```

5.10.33 flash_slib_datastart_sector_get function

The table below describes the function flash_slib_datastart_sector_get.

Table 209. flash_slib_datastart_sector_get function

| Name | Description |
|------------------------|--|
| Function name | flash_slib_datastart_sector_get |
| Function prototype | uint16_t flash_slib_datastart_sector_get(void); |
| Function description | Get the start sector number of sLib data area |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return the start sector number of sLib data area |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint16_t num;  
num = flash_slib_datastart_sector_get();
```

5.10.34 flash_slib_end_sector_get function

The table below describes the function flash_slib_end_sector_get.

Table 210. flash_slib_end_sector_get function

| Name | Description |
|------------------------|---|
| Function name | flash_slib_end_sector_get |
| Function prototype | uint16_t flash_slib_end_sector_get(void); |
| Function description | Get the end sector number of sLib |
| Input parameter | NA |
| Output parameter | NA |
| Return value | Return the end sector number of sLib |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint16_t num;
num = flash_slib_end_sector_get();
```

5.10.35 flash_crc_calibrate function

The table below describes the function flash_crc_calibrate.

Table 211. flash_crc_calibrate function

| Name | Description |
|------------------------|---|
| Function name | flash_crc_calibrate |
| Function prototype | uint32_t flash_crc_calibrate(uint32_t start_sector, uint32_t sector_cnt); |
| Function description | Enable Flash CRC check |
| Input parameter 1 | start_sector: CRC check start sector |
| Input parameter 2 | sector_cnt: CRC check sector count |
| Output parameter | NA |
| Return value | Return CRC calculation result |
| Required preconditions | NA |
| Called functions | NA |

Note: The sector set to go through CRC check is only allowed to be on a single area, rather than on both security library and common area.

Example:

```
uint32_t crc_val;
crc_val = flash_crc_calibrate(0, 10);
```

5.11 General-purpose I/Os and multiplexed I/Os (GPIO/IOMUX)

The GPIO and IOMUX register structure gpio_type and iomux_type are defined in the “at32f413_gpio.h”.

```
/**
 * @brief type define gpio register all
 */
typedef struct
{

} gpio_type;

/**
 * @brief type define iomux register all
 */
typedef struct
{

} iomux_type;
```

The table below gives a list of the GPIO registers.

Table 212. Summary of GPIO registers

| Register | Description |
|----------|----------------------------------|
| cfglr | GPIO configuration register low |
| cfghr | GPIO configuration register high |
| idt | GPIO input data register |
| odt | GPIO output data register |
| scr | GPIO set/clear register |
| clr | GPIO clear register |
| wpr | GPIO write protection register |

The table below gives a list of the IOMUX registers.

Table 213. Summary of IOMUX registers

| Register | Description |
|----------|---|
| evtout | Event output control register |
| remap | IOMUX remap register |
| exintc1 | IOMUX external interrupt configure register 1 |
| exintc2 | IOMUX external interrupt configure register 2 |
| exintc3 | IOMUX external interrupt configure register 3 |
| exintc4 | IOMUX external interrupt configure register 4 |
| remap2 | IOMUX remap register 2 |
| remap3 | IOMUX remap register 3 |
| remap4 | IOMUX remap register 4 |

| Register | Description |
|----------|------------------------|
| remap5 | IOMUX remap register 5 |
| remap6 | IOMUX remap register 6 |
| remap7 | IOMUX remap register 7 |

The table below gives a list of the GPIO and IOMUX library functions.

Table 214. Summary of GPIO and IOMUX library functions

| Function name | Description |
|---------------------------|--|
| gpio_reset | GPIO is reset by CRM reset register |
| gpio_iomux_reset | IOMUX is reset by CRM reset register |
| gpio_init | Initialize GPIO peripherals |
| gpio_default_para_init | Initialize GPIO default parameters |
| gpio_input_data_bit_read | Read GPIO input data bit |
| gpio_input_data_read | Read GPIO input data |
| gpio_output_data_bit_read | Read GPIO output data bit |
| gpio_output_data_read | Read GPIO output data |
| gpio_bits_set | Set GPIO bits |
| gpio_bits_reset | Reset GPIO bits |
| gpio_bits_write | Write GPIO bits |
| gpio_port_write | Write GPIO ports |
| gpio_pin_wp_config | Configure GPIO pin write protection |
| gpio_event_output_config | Configure GPIO event output feature |
| gpio_event_output_enable | Enable/disable GPIO event output feature |
| gpio_pin_remap_config | Configure GPIO pin multiplexed function |
| gpio_exint_line_config | Configure GPIO external interrupt line |

5.11.1 gpio_reset function

The table below describes the function gpio_reset.

Table 215. gpio_reset function

| Name | Description |
|------------------------|---|
| Function name | gpio_reset |
| Function prototype | void gpio_reset(gpio_type *gpio_x); |
| Function description | GPIO is reset by CRM reset register |
| Input parameter | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
gpio_reset(GPIOA);
```

5.11.2 gpio_iomux_reset function

The table below describes the function gpio_iomux_reset.

Table 216. gpio_iomux_reset function

| Name | Description |
|------------------------|--------------------------------------|
| Function name | gpio_iomux_reset |
| Function prototype | void gpio_iomux_reset(); |
| Function description | IOMUX is reset by CRM reset register |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
gpio_iomux_reset();
```

5.11.3 gpio_init function

The table below describes the function gpio_init.

Table 217. gpio_init function

| Name | Description |
|------------------------|---|
| Function name | gpio_init |
| Function prototype | void gpio_init(gpio_type *gpio_x, gpio_init_type *gpio_init_struct); |
| Function description | Initialize GPIO peripheral |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | gpio_init_struct: gpio_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

gpio_init_type structure

The gpio_init_type is defined in the at32f413_gpio.h.

typedef struct

```
{
    uint32_t          gpio_pins;
    gpio_output_type  gpio_out_type;
    gpio_pull_type    gpio_pull;
    gpio_mode_type    gpio_mode;
    gpio_drive_type   gpio_drive_strength;
} gpio_init_type;
```

gpio_pins

Select a GPIO pin.

GPIO_PINS_0: GPIO pin 0

GPIO_PINS_1: GPIO pin 1

GPIO_PINS_2: GPIO pin 2
GPIO_PINS_3: GPIO pin 3
GPIO_PINS_4: GPIO pin 4
GPIO_PINS_5: GPIO pin 5
GPIO_PINS_6: GPIO pin 6
GPIO_PINS_7: GPIO pin 7
GPIO_PINS_8: GPIO pin 8
GPIO_PINS_9: GPIO pin 9
GPIO_PINS_10: GPIO pin 10
GPIO_PINS_11: GPIO pin 11
GPIO_PINS_12: GPIO pin 12
GPIO_PINS_13: GPIO pin 13
GPIO_PINS_14: GPIO pin 14
GPIO_PINS_15: GPIO pin 15

gpio_out_type

Set GPIO output type.

GPIO_OUTPUT_PUSH_PULL: GPIO push-pull
GPIO_OUTPUT_OPEN_DRAIN: GPIOopen-drain

gpio_pull

Set GPIO pull-up or pull-down.

GPIO_PULL_NONE: No GPIO pull-up/pull-down
GPIO_PULL_UP: GPIO pull-up
GPIO_PULL_DOWN: GPIO pull-down

gpio_mode

Set GPIO mode.

GPIO_MODE_INPUT: GPIO input mode
GPIO_MODE_OUTPUT: GPIO output mode
GPIO_MODE_MUX: GPIO multiplexed mode
GPIO_MODE_ANALOG: GPIO analog mode

gpio_drive_strength

Set GPIO drive capability.

GPIO_DRIVE_STRENGTH_STRONGER: Strong drive strength
GPIO_DRIVE_STRENGTH_MODERATE: Moderate drive strength

Example:

```
gpio_init_type gpio_init_struct;  
gpio_init_struct gpio_pins = GPIO_PINS_0;  
gpio_init_struct gpio_mode = GPIO_MODE_MUX;  
gpio_init_struct gpio_out_type = GPIO_OUTPUT_PUSH_PULL;  
gpio_init_struct gpio_pull = GPIO_PULL_NONE;  
gpio_init_struct gpio_drive_strength = GPIO_DRIVE_STRENGTH_STRONGER;  
gpio_init(GPIOA, &gpio_init_struct);
```

5.11.4 gpio_default_para_init function

The table below describes the function gpio_default_para_init.

Table 218. gpio_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | gpio_default_para_init |
| Function prototype | void gpio_default_para_init(gpio_init_type *gpio_init_struct); |
| Function description | Initialize GPIO default parameters. |
| Input parameter | gpio_init_struct: gpio_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The table below describes the default values of members of the gpio_init_struct.

Table 219. gpio_init_struct default values

| Member | Default value |
|---------------------|------------------------------|
| gpio_pins | GPIO_PINS_ALL |
| gpio_mode | GPIO_MODE_INPUT |
| gpio_out_type | GPIO_OUTPUT_PUSH_PULL |
| gpio_pull | GPIO_PULL_NONE |
| gpio_drive_strength | GPIO_DRIVE_STRENGTH_STRONGER |

Example:

```
gpio_init_type gpio_init_struct;
gpio_default_para_init(&gpio_init_struct);
```

5.11.5 gpio_input_data_bit_read function

The table below describes the function gpio_input_data_bit_read.

Table 220. gpio_input_data_bit_read function

| Name | Description |
|------------------------|---|
| Function name | gpio_input_data_bit_read |
| Function prototype | flag_status gpio_input_data_bit_read(gpio_type *gpio_x, uint16_t pins); |
| Function description | Read GPIO input port pins |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pins; refer to gpio_pins for details. |
| Output parameter | NA |
| Return value | Return GPIO input pin status |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_input_data_bit_read(GPIOA, GPIO_PINS_0);
```

5.11.6 gpio_input_data_read function

The table below describes the function gpio_input_data_read.

Table 221. gpio_input_data_read function

| Name | Description |
|------------------------|---|
| Function name | gpio_input_data_read |
| Function prototype | uint16_t gpio_input_data_read(gpio_type *gpio_x); |
| Function description | Read GPIO input ports |
| Input parameter | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Output parameter | NA |
| Return value | Return GPIO input port status |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_input_data_read(GPIOA);
```

5.11.7 gpio_output_data_bit_read function

The table below describes the function gpio_output_data_bit_read.

Table 222. gpio_output_data_bit_read function

| Name | Description |
|------------------------|---|
| Function name | gpio_output_data_bit_read |
| Function prototype | uint16_t gpio_output_data_bit_read(gpio_type *gpio_x); |
| Function description | Read GPIO output port pin |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pins; refer to gpio_pins for details. |
| Output parameter | NA |
| Return value | Return GPIO output pin status |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_output_data_bit_read(GPIOA, GPIO_PINS_0);
```

5.11.8 gpio_output_data_read function

The table below describes the function gpio_output_data_read.

Table 223. gpio_output_data_read function

| Name | Description |
|------------------------|---|
| Function name | gpio_output_data_read |
| Function prototype | uint16_t gpio_output_data_read(gpio_type *gpio_x); |
| Function description | Read GPIO output port |
| Input parameter | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Output parameter | NA |
| Return value | Return GPIO output port status |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_output_data_read(GPIOA);
```

5.11.9 gpio_bits_set function

The table below describes the function gpio_bits_set.

Table 224. gpio_bits_set function

| Name | Description |
|------------------------|---|
| Function name | gpio_bits_set |
| Function prototype | void gpio_bits_set(gpio_type *gpio_x, uint16_t pins); |
| Function description | Set GPIO pins |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pins; refer to gpio_pins for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_bits_set(GPIOA, GPIO_PINS_0);
```

5.11.10 gpio_bits_reset function

The table below describes the function gpio_bits_reset.

Table 225. gpio_bits_reset function

| Name | Description |
|------------------------|---|
| Function name | gpio_bits_reset |
| Function prototype | void gpio_bits_reset(gpio_type *gpio_x, uint16_t pins); |
| Function description | Reset GPIO pins |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pin; refer to gpio_pins for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_bits_reset(GPIOA, GPIO_PINS_0);
```

5.11.11 gpio_bits_write function

The table below describes the function gpio_bits_write.

Table 226. gpio_bits_write function

| Name | Description |
|------------------------|---|
| Function name | gpio_bits_write |
| Function prototype | void gpio_bits_write(gpio_type *gpio_x, uint16_t pins, confirm_state bit_state); |
| Function description | Write GPIO pins |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pin; refer to gpio_pins for details. |
| Input parameter 3 | bit_state: indicates the GPIO pin value; it can be 1 (TRUE) or 0 (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_bits_write(GPIOA, GPIO_PINS_0, TRUE);
```

5.11.12 gpio_port_write function

The table below describes the function gpio_port_write.

Table 227. gpio_port_write function

| Name | Description |
|------------------------|---|
| Function name | gpio_port_write |
| Function prototype | void gpio_port_write(gpio_type *gpio_x, uint16_t port_value); |
| Function description | Write GPIO ports |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | port_value: indicates the port value to write This parameter can be 0x0000~0xFFFF. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_port_write(GPIOA, 0xFFFF);
```

5.11.13 gpio_pin_wp_config function

The table below describes the function gpio_pin_wp_config.

Table 228. gpio_pin_wp_config function

| Name | Description |
|------------------------|---|
| Function name | gpio_pin_wp_config |
| Function prototype | void gpio_pin_wp_config(gpio_type *gpio_x, uint16_t pins); |
| Function description | Configure GPIO pin write protection |
| Input parameter 1 | gpio_x: select a GPIO peripheral. This parameter can be GPIOA, GPIOB, GPIOC, GPIOD or GPIOF. |
| Input parameter 2 | pins: indicates the GPIO pin; refer to gpio_pins for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_pin_wp_config(GPIOA, GPIO_PINS_0);
```

5.11.14 gpio_event_output_config function

The table below describes the function gpio_event_output_config.

Table 229. gpio_event_output_config function

| Name | Description |
|------------------------|--|
| Function name | gpio_event_output_config |
| Function prototype | void gpio_event_output_config(gpio_port_source_type gpio_port_source, gpio_pins_source_type gpio_pin_source); |
| Function description | Configure GPIO event output feature |
| Input parameter 1 | gpio_port_source: indicates the GPIO port |
| Input parameter 2 | gpio_pin_source: indicates the GPIO pin |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

gpio_port_source

Set a GPIO port.

GPIO_PORT_SOURCE_GPIOA: GPIO port A

GPIO_PORT_SOURCE_GPIOB: GPIO port B

GPIO_PORT_SOURCE_GPIOC: GPIO port C

GPIO_PORT_SOURCE_GPIOD: GPIO port D

GPIO_PORT_SOURCE_GPIOF: GPIO port F

gpio_pin_source

Set a GPIO pin.

GPIO_PINS_SOURCE0: GPIO pin 0

GPIO_PINS_SOURCE1: GPIO pin 1

GPIO_PINS_SOURCE2: GPIO pin 2

GPIO_PINS_SOURCE3: GPIO pin 3

GPIO_PINS_SOURCE4: GPIO pin 4

GPIO_PINS_SOURCE5: GPIO pin 5

GPIO_PINS_SOURCE6: GPIO pin 6

GPIO_PINS_SOURCE7: GPIO pin 7

GPIO_PINS_SOURCE8: GPIO pin 8

GPIO_PINS_SOURCE9: GPIO pin 9

GPIO_PINS_SOURCE10: GPIO pin 10

GPIO_PINS_SOURCE11: GPIO pin 11

GPIO_PINS_SOURCE12: GPIO pin 12

GPIO_PINS_SOURCE13: GPIO pin 13

GPIO_PINS_SOURCE14: GPIO pin 14

GPIO_PINS_SOURCE15: GPIO pin 15

Example:

```
gpio_event_output_config(GPIO_PORT_SOURCE_GPIOA, GPIO_PINS_SOURCE0);
```

5.11.15 gpio_event_output_enable function

The table below describes the function gpio_event_output_enable.

Table 230. gpio_event_output_enable function

| Name | Description |
|------------------------|--|
| Function name | gpio_event_output_enable |
| Function prototype | void gpio_event_output_enable(confirm_state new_state); |
| Function description | Enable/disable GPIO event output feature |
| Input parameter | new_state: indicates the GPIO event output status Enable (TRUE) or disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
gpio_event_output_enable(TRUE);
```

5.11.16 gpio_pin_remap_config function

The table below describes the function gpio_pin_remap_config.

Table 231. gpio_pin_remap_config function

| Name | Description |
|------------------------|---|
| Function name | gpio_pin_remap_config |
| Function prototype | void gpio_pin_remap_config(uint32_t gpio_remap, confirm_state new_state); |
| Function description | Configure GPIO pin multiplexed function |
| Input parameter 1 | gpio_remap: indicates a GPIO peripheral |
| Input parameter 2 | new_state: GPIO pin multiplexed status Enable (TRUE) or disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

gpio_remap

Select a GPIO peripheral, including (for details, refer to the Reference Manual):

SPI1_MUX_01: spi1_cs/i2s1_ws(pa15), spi1_sck/i2s1_ck(pb3), spi1_miso(pb4),
spi1_mosi/i2s1_sd(pb5), i2s1_mck(pb0)

I2C1_MUX: i2c1_scl(pb8), i2c1_sda(pb9)

...

SWJTAG_GMUX_100: SWJ and JTAG are disabled (jtag-dp + sw-dp)

PD01_GMUX: pd0/pd1 mapped on osc_in/osc_out

Example:

```
gpio_pin_remap_config(SPI1_MUX_01, TRUE);
```

5.11.17 gpio_exint_line_config function

The table below describes the function `gpio_exint_line_config`.

Table 232. gpio_exint_line_config function

| Name | Description |
|------------------------|--|
| Function name | <code>gpio_exint_line_config</code> |
| Function prototype | <code>void gpio_exint_line_config(gpio_port_source_type gpio_port_source, gpio_pins_source_type gpio_pin_source);</code> |
| Function description | Configure GPIO external interrupt line |
| Input parameter 1 | <code>gpio_port_source</code> : indicates a GPIO port |
| Input parameter 2 | <code>gpio_pin_source</code> : indicates a GPIO pin |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

gpio_port_source

Set a GPIO port. Refer to [`gpio_port_source`](#) for details.

gpio_pin_source

Set a GPIO pin. Refer to [`gpio_pin_source`](#) for details.

Example:

```
gpio_exint_line_config(GPIO_PORT_SOURCE_GPIOA, GPIO_PINS_SOURCE0);
```

5.12 I2C interfaces

The I2C register structure i2c_type is defined in the “at32f413_i2c.h”.

```
/*
 * @brief type define i2c register all
 */
typedef struct
{
    } i2c_type;
```

The table below gives a list of the I2C registers.

Table 233. Summary of I2C registers

| Register | Description |
|----------|------------------------------|
| ctrl1 | I2C control register 1 |
| ctrl2 | I2C control register 2 |
| oaddr1 | I2C own address register 1 |
| oaddr2 | I2C own address register 2 |
| dt | I2C data register |
| sts1 | I2C status register 1 |
| sts2 | I2C status register 2 |
| clkctrl | I2C clock control register |
| tmrise | I2C clock rise time register |

The table below gives a list of the I2C library functions.

Table 234. Summary of I2C library functions

| Function name | Description |
|----------------------------|--|
| i2c_reset | I2C peripheral reset |
| i2c_software_reset | I2C software reset |
| i2c_init | Initialize I2C and set bus speed |
| i2c_own_address1_set | Set I2C own address 1 |
| i2c_own_address2_set | Set I2C own address 2 |
| i2c_own_address2_enable | Enable I2C own address 2 |
| i2c_smbus_enable | Enable Smbus mode |
| i2c_enable | Enable I2C |
| i2c_fast_mode_duty_set | Set fast mode duty cycle |
| i2c_clock_stretch_enable | Enable clock stretching capability |
| i2c_ack_enable | Enable ACK response |
| i2c_master_receive_ack_set | Set master receive mode acknowledge control |
| i2c_pec_position_set | Set PEC position in smbus mode and master receive mode |
| i2c_general_call_enable | Enable general call (broadcast address enable) |
| i2c_arp_mode_enable | Enable SMBus ARP address |
| i2c_smbus_mode_set | Set SMBus device mode |
| i2c_smbus_alert_set | SetSMBus alert pin level |

| | |
|--------------------------|---------------------------------|
| i2c_pec_transmit_enable | Enable PEC transmission |
| i2c_pec_calculate_enable | Enable PEC calculation |
| i2c_pec_value_get | Get the current PEC value |
| i2c_dma_end_transfer_set | Set DMA transfer end indication |
| i2c_dma_enable | Enable DMA transfer |
| i2c_interrupt_enable | Enable I2C interrupt |
| i2c_start_generate | Generate start condition |
| i2c_stop_generate | Generate stop condition |
| i2c_7bit_address_send | Send 7-bit slave address |
| i2c_data_send | Send data |
| i2c_data_receive | Receive data |
| i2c_flag_get | Get flag |
| i2c_flag_clear | Clear flag |

Table 235. Summary of I2C application-layer library functions

| Function name | Description |
|-------------------------|---|
| i2c_config | I2C application initialization |
| i2c_lowlevel_init | I2C low-layer initialization |
| i2c_wait_end | I2C wait data transmit complete |
| i2c_wait_flag | I2C wait flag |
| i2c_master_transmit | I2C master transmits data (polling mode) |
| i2c_master_receive | I2C master receives data (polling mode) |
| i2c_slave_transmit | I2C slave transmits data (polling mode) |
| i2c_slave_receive | I2C slave receives data (polling mode) |
| i2c_master_transmit_int | I2C master transmits data (interrupt mode) |
| i2c_master_receive_int | I2C master receives data (interrupt mode) |
| i2c_slave_transmit_int | I2C slave transmits data (interrupt mode) |
| i2c_slave_receive_int | I2C slave receives data (interrupt mode) |
| i2c_master_transmit_dma | I2C master transmits data (DMA mode) |
| i2c_master_receive_dma | I2C master receives data (DMA mode) |
| i2c_slave_transmit_dma | I2C slave transmits data (DMA mode) |
| i2c_slave_receive_dma | I2C slave receives data (DMA mode) |
| i2c_memory_write | I2C writes data to EEPROM (polling mode) |
| i2c_memory_write_int | I2C writes data to EEPROM (interrupt mode) |
| i2c_memory_write_dma | I2C writes data to EEPROM (DMA mode) |
| i2c_memory_read | I2C reads data from EEPROM (polling mode) |
| i2c_memory_read_int | I2C reads data from EEPROM (interrupt mode) |
| i2c_memory_read_dma | I2C reads data from EEPROM (DMA mode) |
| i2c_evt_irq_handler | I2C event interrupt function |
| i2c_err_irq_handler | I2C error interrupt function |
| i2c_dma_tx_irq_handler | I2C DMA Tx interrupt function |
| i2c_dma_rx_irq_handler | I2C DMA Rx interrupt function |

5.12.1 i2c_reset function

The table below describes the function i2c_reset.

Table 236. i2c_reset function

| Name | Description |
|------------------------|--|
| Function name | i2c_reset |
| Function prototype | void i2c_reset(i2c_type *i2c_x) |
| Function description | Reset all I2C registers to their reset values through CRM (clock and reset management) |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | void crm_periph_reset(crm_periph_reset_type value, confirm_state new_state); |

Example:

```
i2c_reset(I2C1);
```

5.12.2 i2c_software_reset function

The table below describes the function i2c_software_reset.

Table 237. i2c_software_reset function

| Name | Description |
|------------------------|--|
| Function name | i2c_software_reset |
| Function prototype | void i2c_software_reset(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Reset I2C registers by software, obtaining the same result of i2c_reset(i2c_type *i2c_x) |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: software reset status This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_software_reset(I2C1, TRUE);
i2c_software_reset(I2C1, FALSE);
```

5.12.3 i2c_init function

The table below describes the function i2c_init.

Table 238. i2c_init function

| Name | Description |
|------------------------|---|
| Function name | i2c_init |
| Function prototype | void i2c_init(i2c_type *i2c_x, i2c_fsmode_duty_cycle_type duty, uint32_t speed); |
| Function description | Set I2C bus speed and duty cycle in fast mode |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | duty: SCL bus duty cycle in fast mode Refer to the “duty” description below for details. |
| Input parameter 3 | speed: bus speed, in Hz |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

duty

Set SCL bus duty cycle in fast mode (bus speed ≥ 400 kHz).

I2C_FSMODE_DUTY_2_1: 2: 1

I2C_FSMODE_DUTY_16_9: 16: 9

Example:

```
i2c_init(I2C1, I2C_FSMODE_DUTY_2_1, 100000);
```

5.12.4 i2c_own_address1_set function

The table below describes the function i2c_own_address1_set.

Table 239. i2c_own_address1_set function

| Name | Description |
|------------------------|---|
| Function name | i2c_own_address1_set |
| Function prototype | void i2c_own_address1_set(i2c_type *i2c_x, i2c_address_mode_type mode, uint16_t address); |
| Function description | Set I2C own address 1 |
| Input parameter 1 | mode: I2C own address 1 mode Refer to the “mode” description below for details. |
| Input parameter 2 | address: I2C own address 1 |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

mode

Set I2C own address 1 mode.

I2C_ADDRESS_MODE_7BIT: 7-bit address mode

I2C_ADDRESS_MODE_10BIT: 10-bit address mode

Example:

```
i2c_own_address1_set(I2C1, I2C_ADDRESS_MODE_7BIT, 0xA0);
```

5.12.5 i2c_own_address2_set function

The table below describes the function i2c_own_address2_set.

Table 240. i2c_own_address2_set function

| Name | Description |
|------------------------|--|
| Function name | i2c_own_address2_set |
| Function prototype | void i2c_own_address2_set(i2c_type *i2c_x, uint8_t address); |
| Function description | Set I2C own address 2. This address is valid after the own address 2 is enabled. Note that only 7-bit address is supported, not 10-bit address. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | address: own address 2 |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_own_address2_set(I2C1, 0xB0);
```

5.12.6 i2c_own_address2_enable function

The table below describes the function i2c_own_address2_enable.

Table 241. i2c_own_address2_enable function

| Name | Description |
|------------------------|--|
| Function name | i2c_own_address2_enable |
| Function prototype | void i2c_own_address2_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable I2C own address 2. The own address 2 is valid after it is enabled. This function is used together with the i2c_own_address2_set. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable own address 2 This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_own_address2_enable(I2C1, TRUE);
```

5.12.7 i2c_smbus_enable function

The table below describes the function i2c_smbus_enable.

Table 242. i2c_smbus_enable function

| Name | Description |
|------------------------|--|
| Function name | i2c_smbus_enable |
| Function prototype | void i2c_smbus_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable SMBus mode. It is I2C mode by default after power-on reset. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable SMBus mode This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_smbus_enable(I2C1, TRUE);
```

5.12.8 i2c_enable function

The table below describes the function i2c_enable.

Table 243. i2c_enable function

| Name | Description |
|------------------------|---|
| Function name | i2c_enable |
| Function prototype | void i2c_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable I2C |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable I2C This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_enable(I2C1, TRUE);
```

5.12.9 i2c_fast_mode_duty_set function

The table below describes the function i2c_fast_mode_duty_set.

Table 244. i2c_fast_mode_duty_set function

| Name | Description |
|------------------------|---|
| Function name | i2c_fast_mode_duty_set |
| Function prototype | void i2c_fast_mode_duty_set(i2c_type *i2c_x, i2c_fsmode_duty_cycle_type duty); |
| Function description | Set the ratio of SCL bus duty cycle in fast mode.. This function has the same function as “duty” in the void i2c_init(i2c_type *i2c_x, i2c_fsmode_duty_cycle_type duty, uint32_t speed). |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | duty: SCL bus duty cycle in fast mode Refer to the “duty” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

duty

Set SCL bus duty cycle in fast mode (bus speed ≥ 400 kHz).

I2C_FSMODE_DUTY_2_1: 2: 1

I2C_FSMODE_DUTY_16_9: 16: 9

Example:

```
i2c_fast_mode_duty_set(I2C1, I2C_FSMODE_DUTY_2_1);
```

5.12.10 i2c_clock_stretch_enable function

The table below describes the function i2c_clock_stretch_enable.

Table 245. i2c_clock_stretch_enable function

| Name | Description |
|----------------------|---|
| Function name | i2c_clock_stretch_enable |
| Function prototype | void i2c_clock_stretch_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable clock stretching mode. This function is applicable to slave mode only. In most cases, enabling the clock stretching mode is recommended in order to prevent slave from having no sufficient time to receive or send data due to slow process speed, which causes a loss of data. It should be noted that the host must be able to support clock stretching function before using this mode by slave. For example, some hosts based on IO analog are not equipped with the clock stretching capability. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable clock stretching mode This parameter can be TRUE or FALSE. |
| Output parameter | NA |

| Name | Description |
|------------------------|-------------|
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_clock_stretch_enable(I2C1, TRUE);
```

5.12.11 i2c_ack_enable function

The table below describes the function i2c_ack_enable

Table 246. i2c_ack_enable function

| Name | Description |
|------------------------|---|
| Function name | i2c_ack_enable |
| Function prototype | void i2c_ack_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | This function is used to enable ACK or NACK of each byte in master and slave mode. For ACK information on I2C communication protocol, refer to I2C protocol or AT32 reference manual. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: indicates ACK response status This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_ack_enable(I2C1, TRUE);
```

5.12.12 i2c_master_receive_ack_set function

The table below describes the function i2c_master_receive_ack_set.

Table 247. i2c_master_receive_ack_set function

| Name | Description |
|----------------------|---|
| Function name | i2c_master_receive_ack_set |
| Function prototype | void i2c_master_receive_ack_set(i2c_type *i2c_x, i2c_master_ack_type pos) |
| Function description | Master receive mode acknowledge control. In master receive mode, it is used to set the void i2c_ack_enable(i2c_type *i2c_x, confirm_state new_state) control bit, which is used when the number of bytes to receive is equal to 2 so as to ensure that the host responds to ACK in time. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | pos: ACKEN effective bit Refer to the "pos" description below for details. |
| Output parameter | NA |
| Return value | NA |

| Name | Description |
|------------------------|-------------|
| Required preconditions | NA |
| Called functions | NA |

pos

Set ACKEN control bit.

I2C_MASTER_ACK_CURRENT: ACKEN bit controls ACK of the current byte being transferred

I2C_MASTER_ACK_NEXT: ACKEN bit controls ACK of the next byte to be transferred

Example:

```
i2c_master_receive_ack_set(I2C1, TRUE);
```

5.12.13 i2c_pec_position_set function

The table below describes the function i2c_pec_position_set.

Table 248. i2c_pec_position_set function

| Name | Description |
|------------------------|---|
| Function name | i2c_pec_position_set |
| Function prototype | void i2c_pec_position_set(i2c_type *i2c_x, i2c_pec_position_type pos); |
| Function description | Set PEC position in SMBus mode and master receive mode. This bit is used only when the number of bytes to receive is equal to 2 so as to ensure that the host receives PEC and responds to NACK in time. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | pos: PEC position Refer to the "pos" description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pos

Set ACKEN control bit.

I2C_PEC_POSITION_CURRENT: Current byte is PEC

I2C_PEC_POSITION_NEXT: The next byte is PEC

Example:

```
i2c_pec_position_set(I2C1, I2C_PEC_POSITION_CURRENT);
```

5.12.14 i2c_general_call_enable function

The table below describes the function i2c_general_call_enable.

Table 249. i2c_general_call_enable function

| Name | Description |
|------------------------|---|
| Function name | i2c_general_call_enable |
| Function prototype | void i2c_general_call_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable broadcast address. After enabled, broadcast address 0x00 is responded. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: Broadcast address enable state This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|--------------------------------------|
| i2c_general_call_enable(I2C1, TRUE); |
|--------------------------------------|

5.12.15 i2c_arp_mode_enable function

The table below describes the function i2c_arp_mode_enable.

Table 250. i2c_arp_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | i2c_arp_mode_enable |
| Function prototype | void i2c_arp_mode_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable SMBus ARP address. After it is enabled, SMBus host: response to host address 0001000x SMBus device: response to default device address 0001100x Refer to SMBUS protocol for details about ARP protocol. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2 |
| Input parameter 2 | new_state: ARP address status This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|----------------------------------|
| i2c_arp_mode_enable(I2C1, TRUE); |
|----------------------------------|

5.12.16 i2c_smbus_mode_set function

The table below describes the function i2c_smbus_mode_set.

Table 251. i2c_smbus_mode_set function

| Name | Description |
|------------------------|---|
| Function name | i2c_smbus_mode_set |
| Function prototype | void i2c_smbus_mode_set(i2c_type *i2c_x, i2c_smbus_mode_set_type mode); |
| Function description | Select SMBus device mode (SMBus host or SMBus device). |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | mode: SMBus device mode Refer to the “mode” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

mode

Set SMBus device mode.

I2C_SMBUS_MODE_DEVICE: SMBus device

I2C_SMBUS_MODE_HOST: SMBus host

Example:

```
i2c_smbus_mode_set(I2C1, I2C_SMBUS_MODE_HOST);
```

5.12.17 i2c_smbus_alert_set function

The table below describes the function i2c_smbus_alert_set.

Table 252. i2c_smbus_alert_set function

| Name | Description |
|------------------------|---|
| Function name | i2c_smbus_alert_set |
| Function prototype | void i2c_smbus_alert_set(i2c_type *i2c_x, i2c_smbus_alert_set_type level); |
| Function description | Set SMBus alert pin level high or low. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2 |
| Input parameter 2 | level: SMBus alert pin level Refer to the “level” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

level

Set SMBus alert pin level.

I2C_SMBUS_ALERT_LOW: Low level

I2C_SMBUS_ALERT_HIGH: High level

Example:

```
i2c_smbus_alert_set(I2C1, I2C_SMBUS_ALERT_LOW);
```

5.12.18 i2c_pec_transmit_enable function

The table below describes the function i2c_pec_transmit_enable.

Table 253. i2c_pec_transmit_enable function

| Name | Description |
|------------------------|--|
| Function name | i2c_pec_transmit_enable |
| Function prototype | void i2c_pec_transmit_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable PEC transmission (transmit/receive PEC). Once this function is called, PEC is transmitted or received immediately. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable PEC transmission This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_pec_transmit_enable(I2C1, TRUE);
```

5.12.19 i2c_pec_calculate_enable function

The table below describes the function i2c_pec_calculate_enable.

Table 254. i2c_pec_calculate_enable function

| Name | Description |
|------------------------|---|
| Function name | i2c_pec_calculate_enable |
| Function prototype | void i2c_pec_calculate_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable PEC calculation. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable PEC calculation This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_pec_calculate_enable(I2C1, TRUE);
```

5.12.20 i2c_pec_value_get function

The table below describes the function i2c_pec_value_get.

Table 255. i2c_pec_value_get function

| Name | Description |
|------------------------|---|
| Function name | i2c_pec_value_get |
| Function prototype | uint8_t i2c_pec_value_get(i2c_type *i2c_x); |
| Function description | Get the current PEC value |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Output parameter | uint8_t: current PEC value |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
Pec_value = i2c_pec_value_get(I2C1);
```

5.12.21 i2c_dma_end_transfer_set function

The table below describes the function i2c_dma_end_transfer_set.

Table 256. i2c_dma_end_transfer_set function

| Name | Description |
|------------------------|--|
| Function name | i2c_dma_end_transfer_set |
| Function prototype | void i2c_dma_end_transfer_set(i2c_type *i2c_x, confirm_state new_state); |
| Function description | DMA transfer end indication. |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: indicates whether it is the last data This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_dma_end_transfer_set(I2C1, TRUE);
```

5.12.22 i2c_dma_enable function

The table below describes the function i2c_dma_enable.

Table 257. i2c_dma_enable function

| Name | Description |
|------------------------|--|
| Function name | i2c_dma_enable |
| Function prototype | void i2c_dma_enable(i2c_type *i2c_x, confirm_state new_state); |
| Function description | Enable DMA transfer |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | new_state: enable/disable DMA transfer This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|-----------------------------|
| i2c_dma_enable(I2C1, TRUE); |
|-----------------------------|

5.12.23 i2c_interrupt_enable function

The table below describes the function i2c_interrupt_enable.

Table 258. i2c_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | i2c_interrupt_enable |
| Function prototype | void i2c_interrupt_enable(i2c_type *i2c_x, uint16_t source, confirm_state new_state) |
| Function description | Enable I2C interrupt |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | source: interrupt source Refer to the "source" description below for details. |
| Input parameter 3 | new_state: enable/disable interrupt This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

source

Select an interrupt source.

I2C_DATA_INT: Data interrupt

I2C_EV_INT: Event interrupt

I2C_ERR_INT: Error interrupt

Example:

| |
|---|
| i2c_interrupt_enable(I2C1, I2C_DATA_INT, TRUE); |
|---|

5.12.24 i2c_start_generate function

The table below describes the function i2c_start_generate.

Table 259. i2c_start_generate function

| Name | Description |
|------------------------|---|
| Function name | i2c_start_generate |
| Function prototype | void i2c_start_generate(i2c_type *i2c_X); |
| Function description | Generate start condition (for the master) |
| Input parameter 1 | i2c_X: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_start_generate(I2C1);
```

5.12.25 i2c_stop_generate function

The table below describes the function i2c_stop_generate.

Table 260. i2c_stop_generate function

| Name | Description |
|------------------------|---|
| Function name | i2c_stop_generate |
| Function prototype | void i2c_stop_generate(i2c_type *i2c_X); |
| Function description | Generate stop condition. |
| Input parameter 1 | i2c_X: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_stop_generate(I2C1);
```

5.12.26 i2c_7bit_address_send function

The table below describes the function i2c_7bit_address_send.

Table 261. i2c_7bit_address_send function

| Name | Description |
|------------------------|---|
| Function name | i2c_7bit_address_send |
| Function prototype | void i2c_7bit_address_send(i2c_type *i2c_x, uint8_t address, i2c_direction_type direction); |
| Function description | Send 7-bit slave address (for the master) |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | direction: data transfer direction Refer to the "direction" description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

direction

Select data transfer direction.

I2C_DIRECTION_TRANSMIT: Master transmit

I2C_DIRECTION_RECEIVE: Master receive

Example:

```
i2c_7bit_address_send(I2C1, 0xB0, I2C_DIRECTION_TRANSMIT);
```

5.12.27 i2c_data_send function

The table below describes the function i2c_data_send.

Table 262. i2c_data_send function

| Name | Description |
|------------------------|---|
| Function name | i2c_data_send |
| Function prototype | void i2c_data_send(i2c_type *i2c_x, uint8_t data); |
| Function description | Send data |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | data: data to be sent |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_data_send(I2C1, 0x55);
```

5.12.28 i2c_data_receive function

The table below describes the function i2c_data_receive.

Table 263. i2c_data_receive function

| Name | Description |
|------------------------|---|
| Function name | i2c_data_receive |
| Function prototype | uint8_t i2c_data_receive(i2c_type *i2c_x); |
| Function description | Receive data |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Output parameter | uint8_t: data to be received |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
data_value = i2c_data_receive(I2C1);
```

5.12.29 i2c_flag_get function

The table below describes the function i2c_flag_get.

Table 264. i2c_flag_get function

| Name | Description |
|------------------------|---|
| Function name | i2c_flag_get |
| Function prototype | flag_status i2c_flag_get(i2c_type *i2c_x, uint32_t flag); |
| Function description | Get flag status |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | flag: flag selection Refer to the following "flag" descriptions for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

This bit is used to select a flag to get its status. Optional parameters are below:

| | |
|------------------|--|
| I2C_STARTF_FLAG: | Start condition generation complete flag |
| I2C_ADDR7F_FLAG: | 0~7 bit address match flag |
| I2C_TDC_FLAG: | Data transfer complete flag |
| I2C_ADDRHF_FLAG: | Master 9~8 bit address header match flag |
| I2C_STOPF_FLAG: | Stop condition generation complete flag |
| I2C_RDBF_FLAG: | Receive data buffer full flag |
| I2C_TDBE_FLAG: | Transmit data buffer empty flag |
| I2C_BUSERR_FLAG: | Bus error flag |
| I2C_ARLOST_FLAG: | Arbitration lost flag |

| | |
|---------------------|-------------------------------------|
| I2C_ACKFAIL_FLAG: | Acknowledge failure flag |
| I2C_OUF_FLAG: | Overload / underload flag |
| I2C_PECERR_FLAG: | PEC receive error flag |
| I2C_TMOUT_FLAG: | SMBus timeout flag |
| I2C_ALERTF_FLAG: | SMBus alert flag |
| I2C_TRMODE_FLAG: | Transmission mode |
| I2C_BUSYF_FLAG: | Bus busy flag |
| I2C_DIRF_FLAG: | Transfer direction flag |
| I2C_GCADDRF_FLAG: | General call address reception flag |
| I2C_DEVADDRF_FLAG: | SMBus device address reception flag |
| I2C_HOSTADDRF_FLAG: | SMBus host address reception flag |
| I2C_ADDR2_FLAG: | Received address 2 flag |

Example:

```
i2c_flag_get(I2C1, I2C_STARTF_FLAG);
```

5.12.30 i2c_interrupt_flag_get function

The table below describes the function i2c_interrupt_flag_get.

Table 265. i2c_interrupt_flag_get function

| Name | Description |
|------------------------|---|
| Function name | i2c_interrupt_flag_get |
| Function prototype | flag_status i2c_interrupt_flag_get(i2c_type *i2c_x, uint32_t flag); |
| Function description | Get flag status and judge the corresponding interrupt enable bit |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | flag: flag selection Refer to the following “flag” descriptions for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

This bit is used to select a flag to get its status. Optional parameters are below:

| | |
|-------------------|--|
| I2C_STARTF_FLAG: | Start condition generation complete flag |
| I2C_ADDR7F_FLAG: | 0~7 bit address match flag |
| I2C_TDC_FLAG: | Data transfer complete flag |
| I2C_ADDRHF_FLAG: | Master 9~8 bit address header match flag |
| I2C_STOPF_FLAG: | Stop condition generation complete flag |
| I2C_RDBF_FLAG: | Receive data buffer full flag |
| I2C_TDBE_FLAG: | Transmit data buffer empty flag |
| I2C_BUSERR_FLAG: | Bus error flag |
| I2C_ARLOST_FLAG: | Arbitration lost flag |
| I2C_ACKFAIL_FLAG: | Acknowledge failure flag |
| I2C_OUF_FLAG: | Overload / underload flag |
| I2C_PECERR_FLAG: | PEC receive error flag |

- I2C_TMOUT_FLAG: SMBus timeout flag
 I2C_ALERTF_FLAG: SMBus alert flag

Example

```
i2c_interrupt_flag_get(I2C1, I2C_STARTF_FLAG);
```

5.12.31 i2c_flag_clear function

The table below describes the function i2c_flag_clear.

Table 266. i2c_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | i2c_flag_clear |
| Function prototype | void i2c_flag_clear(i2c_type *i2c_x, uint32_t flag); |
| Function description | Clear flag |
| Input parameter 1 | i2c_x: selected I2C peripheral This parameter can be I2C1 or I2C2. |
| Input parameter 2 | flag: flag to be cleared Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

This bit is used to select a flag, including

- I2C_BUSERR_FLAG: Bus error flag
 I2C_ARLOST_FLAG: Arbitration lost flag
 I2C_ACKFAIL_FLAG: Acknowledge failure flag
 I2C_OUF_FLAG: Overload / underload flag
 I2C_PECERR_FLAG: PEC receive error flag
 I2C_TMOUT_FLAG: SMBus timeout flag
 I2C_ALERTF_FLAG: SMBus alert flag
 I2C_ADDR7F_FLAG: 0~7 bit address match flag
 I2C_STOPF_FLAG: Stop condition generation complete flag

Example:

```
i2c_flag_clear(I2C1, I2C_ACKFAIL_FLAG);
```

5.12.32 i2c_config function

The table below describes the function i2c_config.

Table 267. i2c_config function

| Name | Description |
|------------------------|---|
| Function name | i2c_config |
| Function prototype | void i2c_config(i2c_handle_type* hi2c); |
| Function description | I2C initialization function used to initialize I2C. Call the function i2c_lowlevel_init() to initialize I2C peripherals, GPIO, DMA, interrupts and others. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type . |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | void i2c_lowlevel_init(i2c_handle_type* hi2c); |

i2c_handle_type* hi2c

The i2c_handle_type is defined in the i2c_application.h.

typedef struct

```
{
    i2c_type          *i2cx;
    uint8_t            *pbuff;
    __IO uint16_t      pcount;
    __IO uint32_t      mode;
    __IO uint32_t      timeout;
    __IO uint32_t      status;
    __IO i2c_status_type error_code;
    dma_channel_type   *dma_tx_channel;
    dma_channel_type   *dma_rx_channel;
    dma_init_type      dma_init_struct;
}i2c_handle_type;
```

i2cx

Select an I2C peripheral from I2C1 or I2C2.

pbuff

An array of data to be sent or received

pcount

The number of data to be sent or received

mode

I2C communication mode. It is used in internal state machine. Users don't care.

timeout

Communications timeout

status

Transfer status. It is used in internal state machine. Users don't care.

error_code

This bit is used to enumerate error code in the i2c_status_type. When a communication error

occurs, it logs the corresponding error code.

| | |
|--------------------|---|
| I2C_OK: | Communication OK |
| I2C_ERR_STEP_1: | Step 1 error |
| I2C_ERR_STEP_2: | Step 2 error |
| I2C_ERR_STEP_3: | Step 3 error |
| I2C_ERR_STEP_4: | Step 4 error |
| I2C_ERR_STEP_5: | Step 5 error |
| I2C_ERR_STEP_6: | Step 6 error |
| I2C_ERR_STEP_7: | Step 7 error |
| I2C_ERR_STEP_8: | Step 8 error |
| I2C_ERR_STEP_9: | Step 9 error |
| I2C_ERR_STEP_10: | Step 10 error |
| I2C_ERR_STEP_11: | Step 11 error |
| I2C_ERR_STEP_12: | Step 12 error |
| I2C_ERR_START: | START condition send error |
| I2C_ERR_ADDR10: | 10bit address header (bit9~8) send error |
| I2C_ERR_ADDR: | Address send error |
| I2C_ERR_STOP: | STOP condition send error |
| I2C_ERR_ACKFAIL: | Acknowledge error |
| I2C_ERR_TIMEOUT: | Timeout error |
| I2C_ERR_INTERRUPT: | Enter an interrupt when an error event occurred |

dma_tx_channel

I2C transmit DMA channel

dma_rx_channel

I2C receive DMA channel

dma_init_struct

DMA initialization structure

Example:

```
i2c_handle_type hi2c;  
hi2c.i2cx = I2C1;  
i2c_config(&hi2c);
```

5.12.33 i2c_lowlevel_init function

The table below describes the function i2c_lowlevel_init.

Table 268. i2c_lowlevel_init function

| Name | Description |
|------------------------|--|
| Function name | i2c_lowlevel_init |
| Function prototype | void i2c_lowlevel_init(i2c_handle_type* hi2c); |
| Function description | I2C lower-level initialization callback function. It is called in the i2c_config to initialize I2C peripherals, GPIO, DMA, interrupts and others. It requires users to implement I2C initialization inside the function. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type . |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
void i2c_lowlevel_init(i2c_handle_type* hi2c)
{
    if(hi2c->i2cx == I2C1)
    {
        Implement I2C1 initialization
    }
    else if(hi2c->i2cx == I2C2)
    {
        Implement I2C2 initialization
    }
}
```

5.12.34 i2c_wait_end function

The table below describes the function i2c_wait_end.

Table 269. i2c_wait_end function

| Name | Description |
|------------------------|---|
| Function name | i2c_wait_end |
| Function prototype | i2c_status_type i2c_wait_end(i2c_handle_type* hi2c, uint32_t timeout); |
| Function description | Wait for the end of communication. This function is used in DMA and interrupt transfer modes as they are non-blocking functions and can thus be used to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
if (i2c_master_transmit_dma(&hi2c, 0xB0, tx_buf, 8, 0xFFFFFFFF) != I2C_OK)
{
    error_handler(i2c_status);
}

/* wait for the end of communication */
if(i2c_wait_end(&hi2c, 0xFFFFFFFF) != I2C_OK)
{
    error_handler(i2c_status);
}
```

5.12.35 i2c_wait_flag function

The table below describes the function i2c_wait_flag.

Table 270. i2c_wait_flag function

| Name | Description |
|------------------------|--|
| Function name | i2c_wait_flag |
| Function prototype | i2c_status_type i2c_wait_flag(i2c_handle_type* hi2c, uint32_t flag, uint32_t event_check, uint32_t timeout) |
| Function description | Wait for a flag to be set or reset Only BUSFY flag is “wait for a flag to be reset”, and others are “wait for a flag to be set” |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 3 | event_check: check if the event has occurred or not while waiting for a flag Refer to the “event_check” descriptions below for details. |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

flag

Select a flag to wait for.

| | |
|---------------------|--|
| I2C_STARTF_FLAG: | Start condition generation complete flag |
| I2C_ADDR7F_FLAG: | 0~7 bit address match flag |
| I2C_TDC_FLAG: | Data transfer complete flag |
| I2C_ADDRHF_FLAG: | Master 9~8 bit address head match flag |
| I2C_STOPF_FLAG: | Stop condition generation complete flag |
| I2C_RDBF_FLAG: | Receive data buffer full flag |
| I2C_TDBE_FLAG: | Transmit data buffer empty flag |
| I2C_BUSERR_FLAG: | Bus error flag |
| I2C_ARLOST_FLAG: | Arbitration lost flag |
| I2C_ACKFAIL_FLAG: | Acknowledge failure flag |
| I2C_OUF_FLAG: | Overload / underload flag |
| I2C_PECERR_FLAG: | PEC receive error flag |
| I2C_TMOUT_FLAG: | SMBus timeout flag |
| I2C_ALERTF_FLAG: | SMBus alert flag |
| I2C_TRMODE_FLAG: | Transmission mode |
| I2C_BUSYF_FLAG: | Bus busy flag |
| I2C_DIRF_FLAG: | Transfer direction flag |
| I2C_GCADDRF_FLAG: | General call address reception flag |
| I2C_DEVADDRF_FLAG: | SMBus device address reception flag |
| I2C_HOSTADDRF_FLAG: | SMBus host address reception flag |
| I2C_ADDR2_FLAG: | Received address 2 flag |

event_check

Check if the event has occurred or not while waiting for a flag.

I2C_EVENT_CHECK_NONE: None

I2C_EVENT_CHECK_ACKFAIL: Check ACKFAIL event

I2C_EVENT_CHECK_STOP: Check STOP event

Example:

```
i2c_wait_flag(&hi2c, I2C_BUSYF_FLAG, I2C_EVENT_CHECK_NONE, 0xFFFFFFFF);
```

5.12.36 i2c_master_transmit function

The table below describes the function i2c_master_transmit.

Table 271. i2c_master_transmit function

| Name | Description |
|------------------------|--|
| Function name | i2c_master_transmit |
| Function prototype | i2c_status_type i2c_master_transmit(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master sends data (polling mode). This is a blocking function, and so I2C transfer ends after the function is executed. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address of to-be-sent data |
| Input parameter 4 | size: the size of data to be sent |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_transmit(&hi2c, 0xB0, tx_buf, 8, 0xFFFFFFFF);
```

5.12.37 i2c_master_receive function

The table below describes the function i2c_master_receive.

Table 272. i2c_master_receive function

| Name | Description |
|------------------------|---|
| Function name | i2c_master_receive |
| Function prototype | i2c_status_type i2c_master_receive(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master receives data (polling mode). This function is a blocking type. After the execution is done, so does I2C transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address to receive data |
| Input parameter 4 | size: number of data to receive |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_receive(&hi2c, 0xB0, rx_buf, 8, 0xFFFFFFFF);
```

5.12.38 i2c_slave_transmit function

The table below describes the function i2c_slave_transmit.

Table 273. i2c_slave_transmit function

| Name | Description |
|------------------------|--|
| Function name | i2c_slave_transmit |
| Function prototype | i2c_status_type i2c_slave_transmit(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave sends data (polling mode). This function is a blocking type. In other words, after the function execution is done, so does I2C transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address of data to be sent |
| Input parameter 3 | size: number of data to be sent |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|---|
| i2c_slave_transmit(&hi2c, tx_buf, 8, 0xFFFFFFFF); |
|---|

5.12.39 i2c_slave_receive function

The table below describes the function i2c_slave_receive.

Table 274. i2c_slave_receive function

| Name | Description |
|------------------------|---|
| Function name | i2c_slave_receive |
| Function prototype | i2c_status_type i2c_slave_receive(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave receives data (polling mode). This function is a blocking type. In other words, after the function execution is done, so does I2C transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address to receive data |
| Input parameter 3 | size: number of data to be received |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|--|
| i2c_slave_receive(&hi2c, rx_buf, 8, 0xFFFFFFFF); |
|--|

5.12.40 i2c_master_transmit_int function

The table below describes the function i2c_master_transmit_int.

Table 275. i2c_master_transmit_int function

| Name | Description |
|------------------------|--|
| Function name | i2c_master_transmit_int |
| Function prototype | i2c_status_type i2c_master_transmit_int(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master sends data (interrupt mode). This function is a non-blocking type. In other words, after the function execution is done, I2C transfer has not completed yet. In this case, it is possible to call the i2c_wait_end() to wait for the completion of communication. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address of data to be sent |
| Input parameter 4 | size: number of data to be sent |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_transmit_int(&hi2c, 0xB0, tx_buf, 8, 0xFFFFFFFF);
```

5.12.41 i2c_master_receive_int function

The table below describes the function i2c_master_receive_int.

Table 276. i2c_master_receive_int function

| Name | Description |
|------------------------|--|
| Function name | i2c_master_receive_int |
| Function prototype | i2c_status_type i2c_master_receive_int(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master receives data (through interrupt mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address to receive data |
| Input parameter 4 | size: number of data to be received |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_receive_int(&hi2c, 0xB0, rx_buf, 8, 0xFFFFFFFF);
```

5.12.42 i2c_slave_transmit_int function

The table below describes the function i2c_slave_transmit_int.

Table 277. i2c_slave_transmit_int function

| Name | Description |
|----------------------|---|
| Function name | i2c_slave_transmit_int |
| Function prototype | i2c_status_type i2c_slave_transmit_int(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave sends data (through interrupt mode). This function operates in non-blocking mode. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address of data to be sent |
| Input parameter 3 | size: number of data to be sent |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |

| Name | Description |
|------------------------|--|
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_slave_transmit_int(&hi2c, tx_buf, 8, 0xFFFFFFFF);
```

5.12.43 i2c_slave_receive_int function

The table below describes the function i2c_slave_receive_int.

Table 278. i2c_slave_receive_int function

| Name | Description |
|------------------------|--|
| Function name | i2c_slave_receive_int |
| Function prototype | i2c_status_type i2c_slave_receive_int(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave receives data (through interrupt mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() for the completion of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address to receive data |
| Input parameter 3 | size: number of data to be received |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_slave_receive_int(&hi2c, rx_buf, 8, 0xFFFFFFFF);
```

5.12.44 i2c_master_transmit_dma function

The table below describes the function i2c_master_transmit_dma.

Table 279. i2c_master_transmit_dma function

| Name | Description |
|------------------------|---|
| Function name | i2c_master_transmit_dma |
| Function prototype | i2c_status_type i2c_master_transmit_dma(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master sends data (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address of data to be sent |
| Input parameter 4 | size: number of data to be sent |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_transmit_dma(&hi2c, 0xB0, tx_buf, 8, 0xFFFFFFFF);
```

5.12.45 i2c_master_receive_dma function

The table below describes the function i2c_master_receive_dma.

Table 280. i2c_master_receive_dma function

| Name | Description |
|------------------------|--|
| Function name | i2c_master_receive_dma |
| Function prototype | i2c_status_type i2c_master_receive_dma(i2c_handle_type* hi2c, uint16_t address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Master receives data (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | address: slave address |
| Input parameter 3 | pdata: array address to receive data |
| Input parameter 4 | size: number of data to be received |
| Input parameter 5 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_master_receive_dma(&hi2c, 0xB0, rx_buf, 8, 0xFFFFFFFF);
```

5.12.46 i2c_slave_transmit_dma function

The table below describes the function i2c_slave_transmit_dma.

Table 281. i2c_slave_transmit_dma function

| Name | Description |
|------------------------|--|
| Function name | i2c_slave_transmit_dma |
| Function prototype | i2c_status_type i2c_slave_transmit_dma(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave sends data (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address of data to be sent |
| Input parameter 3 | size: number of data to be sent |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_slave_transmit_dma(&hi2c, tx_buf, 8, 0xFFFFFFFF);
```

5.12.47 i2c_slave_receive_dma function

The table below describes the function i2c_slave_receive_dma.

Table 282. i2c_slave_receive_dma function

| Name | Description |
|------------------------|---|
| Function name | i2c_slave_receive_dma |
| Function prototype | i2c_status_type i2c_slave_receive_dma(i2c_handle_type* hi2c, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Slave receives data (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer. Refer to i2c_handle_type for details. |
| Input parameter 2 | pdata: array address to receive data |
| Input parameter 3 | size: number of data to be received |
| Input parameter 4 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code. Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
i2c_slave_receive_dma(&hi2c, rx_buf, 8, 0xFFFFFFFF);
```

5.12.48 i2c_memory_write function

The table below describes the function i2c_memory_write.

Table 283. i2c_memory_write function

| Name | Description |
|------------------------|---|
| Function name | i2c_memory_write |
| Function prototype | i2c_status_type i2c_memory_write(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Write data to EEPROM (through polling mode). This function is a blocking type. In other words, after the function execution is done, so does I2C transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the “mem_address_width” below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM data memory address |
| Input parameter 5 | pdata: array address of data to be sent |
| Input parameter 6 | size: number of data to be sent |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address width

I2C_MEM_ADDR_WIDIH_16: 16-bit address width

Example:

```
i2c_memory_write(&hi2c, 0xA0, 0x05, tx_buf, 8, 0xFFFFFFFF);
```

5.12.49 i2c_memory_write_int function

The table below describes the function i2c_memory_write_int.

Table 284. i2c_memory_write_int function

| Name | Description |
|------------------------|--|
| Function name | i2c_memory_write_int |
| Function prototype | i2c_status_type i2c_memory_write_int(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Write EEPROM (through interrupt mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the "mem_address_width" below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM data memory address |
| Input parameter 5 | pdata: array address of data to be sent |
| Input parameter 6 | size: number of data to be sent |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address bit

I2C_MEM_ADDR_WIDIH_16: 16-bit address bit

Example:

```
i2c_memory_write_int(&hi2c, 0xA0, 0x05, tx_buf, 8, 0xFFFFFFFF);
```

5.12.50 i2c_memory_write_dma function

The table below describes the function i2c_memory_write_dma.

Table 285. i2c_memory_write_dma function

| Name | Description |
|------------------------|--|
| Function name | i2c_memory_write_dma |
| Function prototype | i2c_status_type i2c_memory_write_dma(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Write EEPROM (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the "mem_address_width" below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM data memory address |
| Input parameter 5 | pdata: array address of data to be sent |
| Input parameter 6 | size: number of data to be sent |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address width

I2C_MEM_ADDR_WIDIH_16: 16-bit address width

Example:

```
i2c_memory_write_dma(&hi2c, 0xA0, 0x05, tx_buf, 8, 0xFFFFFFFF);
```

5.12.51 i2c_memory_read function

The table below describes the function i2c_memory_read

Table 286. i2c_memory_read function

| Name | Description |
|------------------------|--|
| Function name | i2c_memory_read |
| Function prototype | i2c_status_type i2c_memory_read(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Read EEPROM (through polling mode). This function is a blocking type. In other words, after the function execution is done, so does I2C transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the "mem_address_width" below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM date memory address |
| Input parameter 5 | pdata: array address of data to be read |
| Input parameter 6 | size: number of data to be read |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address width

I2C_MEM_ADDR_WIDIH_16: 16-bit address width

Example:

```
i2c_memory_read(&hi2c, 0xA0, 0x05, rx_buf, 8, 0xFFFFFFFF);
```

5.12.52 i2c_memory_read_int function

The table below describes the function i2c_memory_read_int.

Table 287. i2c_memory_read_int function

| Name | Description |
|------------------------|---|
| Function name | i2c_memory_read_int |
| Function prototype | i2c_status_type i2c_memory_read_int(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Read EEPROM (through interrupt mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the "mem_address_width" below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM data memory address |
| Input parameter 5 | pdata: array address of data to be read |
| Input parameter 6 | size: number of data to be read |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address width

I2C_MEM_ADDR_WIDIH_16: 16-bit address width

Example:

```
i2c_memory_read_int(&hi2c, 0xA0, 0x05, rx_buf, 8, 0xFFFFFFFF);
```

5.12.53 i2c_memory_read_dma function

The table below describes the function i2c_memory_read_dma.

Table 288. i2c_memory_read_dma function

| Name | Description |
|------------------------|---|
| Function name | i2c_memory_read_dma |
| Function prototype | i2c_status_type i2c_memory_read_dma(i2c_handle_type* hi2c, i2c_mem_address_width_type mem_address_width, uint16_t address, uint16_t mem_address, uint8_t* pdata, uint16_t size, uint32_t timeout); |
| Function description | Read EEPROM (through DMA mode). This function is a non-blocking type. In other words, after the function is executed, the I2C transfer has not completed yet. So in this case, it is possible to call the i2c_wait_end() to wait for the end of transfer. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Input parameter 2 | mem_address_width: EEPROM memory address width Refer to the "mem_address_width" below for details. |
| Input parameter 3 | address: EEPROM address |
| Input parameter 4 | mem_address: EEPROM data memory address |
| Input parameter 5 | pdata: array address of data to be read |
| Input parameter 6 | size: number of data to be read |
| Input parameter 7 | timeout: wait timeout |
| Output parameter | NA |
| Return value | i2c_status_type: error code Refer to 5.12.32 for details. |
| Required preconditions | NA |
| Called functions | NA |

mem_address_width

EEPROM memory address width

I2C_MEM_ADDR_WIDIH_8: 8-bit address width

I2C_MEM_ADDR_WIDIH_16: 16-bit address width

Example:

```
i2c_memory_read_dma(&hi2c, 0xA0, 0x05, rx_buf, 8, 0xFFFFFFFF);
```

5.12.54 i2c_evt_irq_handler function

The table below describes the function i2c_evt_irq_handler.

Table 289. i2c_evt_irq_handler function

| Name | Description |
|------------------------|--|
| Function name | i2c_evt_irq_handler |
| Function prototype | void i2c_evt_irq_handler(i2c_handle_type* hi2c); |
| Function description | Event interrupt function. It is used to handle I2C event interrupt. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
void I2C1_EVT_IRQHandler(void)
{
    i2c_evt_irq_handler(&hi2c);
}
```

5.12.55 i2c_err_irq_handler function

The table below describes the function i2c_err_irq_handler.

Table 290. i2c_err_irq_handler function

| Name | Description |
|------------------------|--|
| Function name | i2c_err_irq_handler |
| Function prototype | void i2c_err_irq_handler(i2c_handle_type* hi2c); |
| Function description | Error interrupt function. It is used to handle I2C error interrupt. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
void I2C1_ERR_IRQHandler(void)
{
    i2c_err_irq_handler(&hi2c);
}
```

5.12.56 i2c_dma_tx_irq_handler function

The table below describes the function i2c_dma_tx_irq_handler.

Table 291. i2c_dma_tx_irq_handler function

| Name | Description |
|------------------------|--|
| Function name | i2c_dma_tx_irq_handler |
| Function prototype | void i2c_dma_tx_irq_handler(i2c_handle_type* hi2c); |
| Function description | DMA transmit interrupt function. It is used to handle DMA transmit interrupt. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
void DMA1_Channel6_IRQHandler(void)
{
    i2c_dma_rx_irq_handler(&hi2c);
}
```

5.12.57 i2c_dma_rx_irq_handler function

The table below describes the function i2c_dma_rx_irq_handler.

Table 292. i2c_dma_rx_irq_handler function

| Name | Description |
|------------------------|--|
| Function name | i2c_dma_rx_irq_handler |
| Function prototype | void i2c_dma_rx_irq_handler(i2c_handle_type* hi2c); |
| Function description | DMA receive interrupt function. It is used to handle DMA receive interrupt. |
| Input parameter 1 | hi2c: i2c_handle_type pointer Refer to i2c_handle_type for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
void DMA1_Channel7_IRQHandler(void)
{
    i2c_dma_tx_irq_handler(&hi2c);
}
```

5.13 Nested vectored interrupt controller (NVIC)

The NVIC register structure NVIC_Type is defined in the “core_cm4.h”.

```
/*
 * @brief Structure type to access the Nested Vectored Interrupt Controller (NVIC).
 */
typedef struct
{
    .....
} NVIC_Type;
```

The table below gives a list of the NVIC registers.

Table 293. Summary of NVIC registers

| Register | Description |
|----------|-------------------------------------|
| iser | Interrupt enable set register |
| icer | Interrupt enable clear register |
| ispr | Interrupt suspend set register |
| icpr | Interrupt suspend clear register |
| iabr | Interrupt activate bit register |
| ip | Interrupt priority register |
| stir | Software trigger interrupt register |

The table below gives a list of the NVIC library functions.

Table 294. Summary of NVIC library functions

| Function name | Description |
|----------------------------|---|
| nvic_system_reset | System software reset |
| nvic_irq_enable | NVIC interrupt enable and priority enable |
| nvic_irq_disable | NVIC interrupt disable |
| nvic_priority_group_config | NVIC interrupt priority grouping configuration |
| nvic_vector_table_set | NVIC interrupt vector table base address and offset address configuration |
| nvic_lowpower_mode_config | NVIC low-power mode configuration |

5.13.1 nvic_system_reset function

The table below describes the function nvic_system_reset.

Table 295. nvic_system_reset function

| Name | Description |
|------------------------|------------------------------|
| Function name | nvic_system_reset |
| Function prototype | void nvic_system_reset(void) |
| Function description | System software reset |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NVIC_SystemReset() |

Example:

```
/* system reset */
nvic_system_reset();
```

5.13.2 nvic_irq_enable function

The table below describes the function nvic_irq_enable.

Table 296. nvic_irq_enable function

| Name | Description |
|------------------------|--|
| Function name | nvic_irq_enable |
| Function prototype | void nvic_irq_enable(IRQn_Type irqn, uint32_t preempt_priority, uint32_t sub_priority) |
| Function description | NVIC interrupt enable and priority configuration |
| Input parameter 1 | irqn: interrupt vector selection Refer to <i>irqn</i> for details. |
| Input parameter 2 | preempt_priority: set preemption priority This parameter cannot be greater than the highest preemption priority defined in the NVIC_PRIORITY_GROUP_x. |
| Input parameter 3 | sub_priority: set response priority This parameter cannot be greater than the highest response priority defined in the NVIC_PRIORITY_GROUP_x. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NVIC_SetPriority() NVIC_EnableIRQ() |

irqn

The irqn is used to select interrupt vectors, including

WWDT_IRQn: Window timer interrupt

PVM_IRQn: PVM interrupt linked to EXINT

.....

USBFS_MAPL_IRQn: USBFS remap low priority interrupt

DMA2_Channel6_7_IRQn: DMA2 channel 6 and DMA2 channel 7 global interrupts

Example:

```
/* enable nvic irq */
nvic_irq_enable(ADC1_2_IRQn, 0, 0);
```

5.13.3 nvic_irq_disable function

The table below describes the function nvic_irq_disable.

Table 297. nvic_irq_disable function

| Name | Description |
|------------------------|---|
| Function name | nvic_irq_disable |
| Function prototype | void nvic_irq_disable(IRQn_Type irqn) |
| Function description | NVIC interrupt enable |
| Input parameter | irqn: select interrupt vector. Refer to irqn for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NVIC_DisableIRQ() |

Example:

```
/* disable nvic irq */
nvic_irq_disable(ADC1_2_IRQn);
```

5.13.4 nvic_priority_group_config function

The table below describes the function nvic_priority_group_config.

Table 298. nvic_priority_group_config function

| Name | Description |
|------------------------|--|
| Function name | nvic_priority_group_config |
| Function prototype | void nvic_priority_group_config(nvic_priority_group_type priority_group) |
| Function description | NVIC interrupt priority grouping configuration |
| Input parameter | priority_group: select interrupt priority group This parameter can be any enumerated value in the nvic_priority_group_type. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NVIC_SetPriorityGrouping() |

priority_group

The priority_group is used to select priority group from the parameters below:

NVIC_PRIORITY_GROUP_0:

Priority group 0 (0 bit for preemption priority, and 4 bits for response priority)

NVIC_PRIORITY_GROUP_1:

Priority group 1 (1 bit for preemption priority, and 3 bits for response priority)

NVIC_PRIORITY_GROUP_2:

Priority group 2 (2 bits for preemption priority, and 2 bits for response priority)

NVIC_PRIORITY_GROUP_3:

Priority group 3 (3 bits for preemption priority, and 1 bit for response priority)

NVIC_PRIORITY_GROUP_4:

Priority group 4 (4 bits for preemption priority, and 0 bit for response priority)

Example:

```
/* config nvic priority group */
```

```
nvic_priority_group_config(NVIC_PRIORITY_GROUP_4);
```

5.13.5 nvic_vector_table_set function

The table below describes the function nvic_vector_table_set.

Table 299. nvic_vector_table_set function

| Name | Description |
|------------------------|---|
| Function name | nvic_vector_table_set |
| Function prototype | void nvic_vector_table_set(uint32_t base, uint32_t offset) |
| Function description | Set NVIC interrupt vector table base address and offset address |
| Input parameter 1 | base: base address of interrupt vector table The base address can be set in RAM or FLASH. |
| Input parameter 2 | offset: offset address of interrupt vector table This parameter defines the start address of interrupt vector table, so it must be set to a multiple of 0x200. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

base

The base is used to select the base address of interrupt vector table, including:

NVIC_VECTTAB_RAM: Interrupt vector table base address is located in RAM

NVIC_VECTTAB_FLASH: Interrupt vector table base address is located in FLASH

Example:

```
/* config vector table offset */  
nvic_vector_table_set(NVIC_VECTTAB_FLASH, 0x4000);
```

5.13.6 nvic_lowpower_mode_config function

The table below describes the function nvic_lowpower_mode_config.

Table 300. nvic_lowpower_mode_config function

| Name | Description |
|------------------------|--|
| Function name | nvic_lowpower_mode_config |
| Function prototype | void nvic_lowpower_mode_config(nvic_lowpower_mode_type lp_mode, confirm_state new_state) |
| Function description | Configure NVIC low-power mode |
| Input parameter 1 | lp_mode: select low-power modes This parameter can be any enumerated value in the nvic_lowpower_mode_type. |
| Input parameter 2 | new_state: indicates the pre-configured status of battery powered domain This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

lp_mode

The lp_mode is used to select low-power modes, including:

NVIC_LP_SEVONPEND:

Send wakeup event upon interrupt suspend (this option is usually used in conjunction with WFE)

NVIC_LP_SLEEPDEEP:

Deepsleep mode control bit (enable or disable core clock)

NVIC_LP_SLEEPONEXIT:

Sleep mode entry when system leaves the lowest-priority interrupt

Example:

```
/* enable sleep-on-exit feature */  
nvic_lowpower_mode_config(NVIC_LP_SLEEPONEXIT, TRUE);
```

5.14 Power controller (PWC)

The PWC register structure pwc_type is defined in the “at32f413_pwc.h”.

```
/*
 * @brief type define pwc register all
 */
typedef struct
{
    .....
} pwc_type;
```

The table below gives a list of the PWC registers.

Table 301. Summary of PWC registers

| Register | Description |
|----------|-------------------------------|
| ctrl | Power control register |
| ctrlsts | Power control/status register |

The table below gives a list of the PWC library functions.

Table 302. Summary of PWC library functions

| Function name | Description |
|----------------------------------|---|
| pwc_reset | Reset PWC registers to their reset values |
| pwc_batteryPoweredDomainAccess | Enable battery powered domain access |
| pwc_pvm_level_select | Select PVM threshold |
| pwc_power_voltage_monitor_enable | Enable voltage monitor |
| pwc_wakeupPinEnable | Enable standby-mode wakeup pin |
| pwc_flag_clear | Clear flag |
| pwc_flag_get | Get flag |
| pwc_sleepModeEnter | Enter Sleep mode |
| pwc_deepSleepModeEnter | Enter Deepsleep mode |
| pwc_standbyModeEnter | Enter Standby mode |

5.14.1 pwc_reset function

The table below describes the function pwc_reset.

Table 303. pwc_reset function

| Name | Description |
|------------------------|--|
| Function name | pwc_reset |
| Function prototype | void pwc_reset(void) |
| Function description | Reset all PWC registers to their reset values. |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset() |

Example:

```
/* deinitialize pwc */
pwc_reset();
```

5.14.2 pwc_batteryPoweredDomainAccess function

The table below describes the function pwc_batteryPoweredDomainAccess.

Table 304. pwc_batteryPoweredDomainAccess function

| Name | Description |
|------------------------|--|
| Function name | pwc_batteryPoweredDomainAccess |
| Function prototype | void pwc_batteryPoweredDomainAccess(confirm_state new_state) |
| Function description | Battery powered domain access enable |
| Input parameter | new_state: indicates the pre-configured status of battery powered domain This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the battery-powered domain write operations */
pwc_batteryPoweredDomainAccess(TRUE);
```

Note: Access to battery powered domain (such as, RTC) is allowed only after enabling it through this function.

5.14.3 pwcPvmLevelSelect function

The table below describes the function pwcPvmLevelSelect.

Table 305. pwcPvmLevelSelect function

| Name | Description |
|------------------------|---|
| Function name | pwcPvmLevelSelect |
| Function prototype | void pwcPvmLevelSelect(pwcPvmVoltageType pvm_voltage) |
| Function description | Select PVM threshold |
| Input parameter | pvm_voltage: indicates the selected PVM threshold This parameter can be any enumerated value in the pwcPvmVoltageType. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pvm_voltage

The pvm_voltage is used to select a PVM threshold from the optional parameters below:

PWC_PVM_VOLTAGE_2V3: PVM threshold is 2.3V

PWC_PVM_VOLTAGE_2V4: PVM threshold is 2.4V

PWC_PVM_VOLTAGE_2V5: PVM threshold is 2.5V

PWC_PVM_VOLTAGE_2V6: PVM threshold is 2.6V

PWC_PVM_VOLTAGE_2V7: PVM threshold is 2.7V

PWC_PVM_VOLTAGE_2V8: PVM threshold is 2.8V

PWC_PVM_VOLTAGE_2V9: PVM threshold is 2.9V

Example:

```
/* set the threshold voltage to 2.9v */
pwc_pvm_level_select(PWC_PVM_VOLTAGE_2V9);
```

5.14.4 pwc_power_voltage_monitor_enable function

The table below describes the function pwc_power_voltage_monitor_enable.

Table 306. pwc_power_voltage_monitor_enable function

| Name | Description |
|------------------------|---|
| Function name | pwc_power_voltage_monitor_enable |
| Function prototype | void pwc_power_voltage_monitor_enable(confirm_state new_state) |
| Function description | Enable power voltage monitor (PVM) |
| Input parameter | new_state: indicates the pre-configured status of PVM This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable power voltage monitor */
pwc_power_voltage_monitor_enable(TRUE);
```

5.14.5 pwc_wakeup_pin_enable function

The table below describes the function pwc_wakeup_pin_enable.

Table 307. pwc_wakeup_pin_enable function

| Name | Description |
|------------------------|---|
| Function name | pwc_wakeup_pin_enable |
| Function prototype | void pwc_wakeup_pin_enable(uint32_t pin_num, confirm_state new_state) |
| Function description | Enable Standby wakeup pin |
| Input parameter 1 | pin_num: select a standby wakeup pin This parameter can be any pin that is capable of waking up from Standby mode. |
| Input parameter 2 | new_state: indicates the pre-configured status of Standby wakeup pins This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pin_num

The pin_num is used to select Standby-mode wakeup pin, including:

PWC_WAKEUP_PIN_1: Standby wakeup pin 1 (corresponding GPIO is PA0)

Example:

```
/* enable wakeup pin - pa0 */
```

```
pwc_wakeup_pin_enable(PWC_WAKEUP_PIN_1, TRUE);
```

5.14.6 pwc_flag_clear function

The table below describes the function pwc_flag_clear.

Table 308. pwc_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | pwc_flag_clear |
| Function prototype | void pwc_flag_clear(uint32_t pwc_flag) |
| Function description | Clear flag |
| Input parameter | pwc_flag: to-be-cleared flag Refer to pwc_flag for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pwc_flag

The pwc_flag is used to select a flag from the optional parameters below:

PWC_WAKEUP_FLAG: Standby wakeup event

PWC_STANDBY_FLAG: Standby mode entry

PWC_PVM_OUTPUT_FLAG: PVM output (this parameter cannot be cleared by software)

Example:

```
/* wakeup event flag clear */
pwc_flag_clear(PWC_WAKEUP_FLAG);
```

5.14.7 pwc_flag_get function

The table below describes the function pwc_flag_get.

Table 309. pwc_flag_get function

| Name | Description |
|------------------------|--|
| Function name | pwc_flag_get |
| Function prototype | flag_status pwc_flag_get(uint32_t pwc_flag) |
| Function description | Get flag status |
| Input parameter | pwc_flag: select a flag. Refer to pwc_flag for details. |
| Output parameter | NA |
| Return value | flag_status: indicates flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* check if wakeup event flag is set */
if(pwc_flag_get(PWC_WAKEUP_FLAG) != RESET)
```

5.14.8 pwc_sleep_mode_enter function

The table below describes the function pwc_sleep_mode_enter.

Table 310. pwc_sleep_mode_enter function

| Name | Description |
|------------------------|--|
| Function name | pwc_sleep_mode_enter |
| Function prototype | void pwc_sleep_mode_enter(pwc_sleep_enter_type pwc_sleep_enter) |
| Function description | Enter Sleep mode |
| Input parameter | pwc_sleep_enter: select a command to enter Sleep mode This parameter can be any enumerated value in the pwc_sleep_enter_type. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pwc_sleep_enter

The pwc_sleep_enter is used to select a command to enter Sleep mode from the optional parameters below:

- PWC_SLEEP_ENTER_WFI: Enter Sleep mode by WFI
PWC_SLEEP_ENTER_WFE: Enter Sleep mode by WFE

Example:

```
/* enter sleep mode */
pwc_sleep_mode_enter(PWC_SLEEP_ENTER_WFI);
```

5.14.9 pwc_deep_sleep_mode_enter function

The table below describes the function pwc_deep_sleep_mode_enter.

Table 311. pwc_deep_sleep_mode_enter function

| Name | Description |
|------------------------|--|
| Function name | pwc_deep_sleep_mode_enter |
| Function prototype | void pwc_deep_sleep_mode_enter(pwc_deep_sleep_enter_type pwc_deep_sleep_enter) |
| Function description | Enter Deepsleep mode |
| Input parameter | pwc_deep_sleep_enter: select a command to enter Deepsleep mode This parameter can be any enumerated value in the pwc_deep_sleep_enter_type. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

pwc_deep_sleep_enter

The pwc_deep_sleep_enter is used to select a command to enter Deepsleep mode, including:

- PWC_DEEP_SLEEP_ENTER_WFI: Enter Deepsleep mode by WFI
PWC_DEEP_SLEEP_ENTER_WFE: Enter Deepsleep mode by WFE

Example:

```
/* enter deep sleep mode */
pwc_deep_sleep_mode_enter(PWC_DEEP_SLEEP_ENTER_WFI);
```

5.14.10 pwc_standby_mode_enter function

The table below describes the function pwc_standby_mode_enter.

Table 312. pwc_standby_mode_enter function

| Name | Description |
|------------------------|-----------------------------------|
| Function name | pwc_standby_mode_enter |
| Function prototype | void pwc_standby_mode_enter(void) |
| Function description | Enter Standby mode |
| Input parameter | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enter standby mode */  
pwc_standby_mode_enter();
```

5.15 Real-time clock (RTC)

The RTC register structure `rtc_type` is defined in the “`at32f413_rtc.h`”.

```
/*
 * @brief type define rtc register all
 */
typedef struct
{
    } rtc_type;
```

The table below gives a list of the RTC registers.

Table 313. Summary of RTC registers

| Register | Description |
|----------|-----------------------------------|
| ctrlh | RTC control register high |
| ctrll | RTC control register low |
| divh | RTC divider register high |
| divl | RTC divider register low |
| divcnth | RTC divider counter register high |
| divcntl | RTC divider counter register low |
| cnth | RTC counter value register high |
| cntl | RTC counter value register low |
| tah | RTC alarm register high |
| tal | RTC alarm register low |

The table below gives a list of the RTC library functions.

Table 314. Summary of RTC library functions

| Function name | Description |
|-------------------------------------|-------------------------------------|
| <code>rtc_counter_set</code> | Set RTC counter value |
| <code>rtc_counter_get</code> | Get RTC counter value |
| <code>rtc_divider_set</code> | Set RTC divider |
| <code>rtc_divider_get</code> | Get RTC division value |
| <code>rtc_alarm_set</code> | Set RTC clock |
| <code>rtc_interrupt_enable</code> | Enable RTC interrupt |
| <code>rtc_flag_get</code> | Get RTC flag |
| <code>rtc_flag_clear</code> | Clear RTC flag |
| <code>rtc_wait_config_finish</code> | Wait for RTC configuration complete |
| <code>rtc_wait_update_finish</code> | Wait for RTC update complete |

5.15.1 rtc_counter_set function

The table below describes the function rtc_counter_set.

Table 315. rtc_counter_set function

| Name | Description |
|------------------------|---|
| Function name | rtc_counter_set |
| Function prototype | void rtc_counter_set(uint32_t counter_value); |
| Function description | Set RTC counter value |
| Input parameter 1 | counter_value: RTC counter value, range: 0~0xFFFFFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
rtc_counter_set(0x00000008);
```

5.15.2 rtc_counter_get function

The table below describes the function rtc_counter_get.

Table 316. rtc_counter_get function

| Name | Description |
|------------------------|---|
| Function name | rtc_counter_get |
| Function prototype | uint32_t rtc_counter_get(void); |
| Function description | Get RTC counter value |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | uint32_t: current counter value, generally incremented by 1 |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
value = rtc_counter_get();
```

5.15.3 rtc_divider_set function

The table below describes the function rtc_divider_set.

Table 317. rtc_divider_set function

| Name | Description |
|------------------------|--|
| Function name | rtc_divider_set |
| Function prototype | void rtc_divider_set(uint32_t div_value); |
| Function description | Set RTC divider |
| Input parameter 1 | div_value: RTC division value, range: 0~0x000FFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
rtc_divider_set(32767);
```

5.15.4 rtc_divider_get function

The table below describes the function rtc_divider_get.

Table 318. rtc_divider_get function

| Name | Description |
|------------------------|----------------------------------|
| Function name | rtc_divider_get |
| Function prototype | uint32_t rtc_divider_get(void); |
| Function description | Get RTC division value |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | uint32_t: current division value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
value = rtc_divider_get();
```

5.15.5 rtc_alarm_set function

The table below describes the function rtc_alarm_set.

Table 319. rtc_alarm_set function

| Name | Description |
|------------------------|---|
| Function name | rtc_alarm_set |
| Function prototype | void rtc_alarm_set(uint32_t alarm_value); |
| Function description | Set RTC alarm |
| Input parameter 1 | alarm_value: RTC alarm, range: 0~0xFFFFFFFF The alarm event occurs when the current RTC counter value reaches the RTC alarm value. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
rtc_alarm_set(0x00000006);
```

5.15.6 rtc_interrupt_enable function

The table below describes the function rtc_interrupt_enable.

Table 320. rtc_interrupt_enable function

| Name | Description |
|------------------------|---|
| Function name | rtc_interrupt_enable |
| Function prototype | void rtc_interrupt_enable(uint16_t source, confirm_state new_state); |
| Function description | Enable interrupt |
| Input parameter 1 | source: interrupt source Refer to the "source" below for details. |
| Input parameter 2 | new_state: enable/disable interrupt This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

source

It is used to select an interrupt source.

RTC_TS_INT: Second clock interrupt

RTC_TA_INT: Alarm interrupt

RTC_OVF_INT: Counter overflow interrupt

Example:

```
rtc_interrupt_enable(RTC_TS_INT, TRUE);
```

5.15.7 rtc_flag_get function

The table below describes the function `rtc_flag_get`.

Table 321. `rtc_flag_get` function

| Name | Description |
|------------------------|--|
| Function name | <code>rtc_flag_get</code> |
| Function prototype | <code>flag_status rtc_flag_get(uint16_t flag);</code> |
| Function description | Get flag status |
| Input parameter 1 | flag: flag selection Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

It is used to select a flag, including:

- RTC_TS_FLAG: Second clock flag
- RTC_TA_FLAG: Alarm flag
- RTC_OVF_FLAG: Counter value overflow flag
- RTC_UPDF_FLAG: Time update flag
- RTC_CGF_FLAG: RTC register configuration complete flag

Example:

```
rtc_flag_get(RTC_TS_FLAG);
```

5.15.8 rtc_interrupt_flag_get function

The table below describes the function `rtc_interrupt_flag_get`.

Table 322. `rtc_interrupt_flag_get` function

| Name | Description |
|------------------------|---|
| Function name | <code>rtc_interrupt_flag_get</code> |
| Function prototype | <code>flag_status rtc_interrupt_flag_get(uint16_t flag);</code> |
| Function description | Get flag status and judge the corresponding interrupt enable bit |
| Input parameter 1 | flag flag selection Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

It is used to select a flag, including:

- RTC_TS_FLAG: Second clock flag
- RTC_TA_FLAG: Alarm flag
- RTC_OVF_FLAG: Counter value overflow flag

Example

```
rtc_interrupt_flag_get(RTC_TS_FLAG);
```

5.15.9 rtc_flag_clear function

The table below describes the function `rtc_flag_clear`.

Table 323. `rtc_flag_clear` function

| Name | Description |
|------------------------|--|
| Function name | <code>rtc_flag_clear</code> |
| Function prototype | <code>void rtc_flag_clear(uint16_t flag);</code> |
| Function description | Clear flag |
| Input parameter 1 | flag: to-be-cleared flag Refer to the “flag” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

It is used to select a flag, including:

- RTC_TS_FLAG: Second clock flag
- RTC_TA_FLAG: Alarm flag
- RTC_OVF_FLAG: Counter value overflow flag
- RTC_UPDF_FLAG: Time update flag

Example:

```
rtc_flag_clear(RTC_TS_FLAG);
```

5.15.10 rtc_wait_config_finish function

The table below describes the function `rtc_wait_config_finish`.

Table 324. `rtc_wait_config_finish` function

| Name | Description |
|------------------------|---|
| Function name | <code>rtc_wait_config_finish</code> |
| Function prototype | <code>void rtc_wait_config_finish(void);</code> |
| Function description | Wait for RTC configuration complete |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
rtc_wait_config_finish();
```

5.15.11 rtc_wait_update_finish function

The table below describes the function rtc_wait_update_finish.

Table 325. rtc_wait_update_finish function

| Name | Description |
|------------------------|------------------------------------|
| Function name | rtc_wait_update_finish |
| Function prototype | void rtc_wait_update_finish(void); |
| Function description | Wait for RTC update complete |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
rtc_wait_update_finish();
```

5.16 SDIO interface (SDIO)

The SDIO register structure `crm_type` is defined in the “`at32f413_sdio.h`”.

```
/*
 * @brief type define sdio register all
 */
typedef struct
{
    ...
} sdio_type;
```

The table below gives a list of the SDIO registers.

Table 326. Summary of SDIO registers

| Register | Description |
|----------|---------------------------|
| pwrctrl | Power control register |
| clkctrl | Clock control register |
| arg | Argument register |
| cmd | Command register |
| rspcmd | Command response register |
| rsp1 | Response register1 |
| rsp2 | Response register 2 |
| rsp3 | Response register 3 |
| rsp4 | Response register 4 |
| dttmr | Data timer register |
| dtlen | Data length register |
| dtctrl | Data control register |
| dtcntr | Data counter register |
| sts | Status register |
| intclr | Clear interrupt register |
| inten | Interrupt mask register |
| bufcntr | BUF counter register |
| buf | Data BUF register |

The table below gives a list of the SDIO library functions.

Table 327. Summary of SDIO library functions

| Function name | Description |
|-------------------------------|--|
| sdio_reset | Reset SDIO peripheral registers and control status |
| sdio_power_set | Configure controller power status |
| sdio_power_status_get | Get controller power status |
| sdio_clock_config | Configure clock parameters |
| sdio_bus_width_config | Configure bus width |
| sdio_clock_bypass | Enable clock bypass mode |
| sdio_power_saving_mode_enable | Enable controller power-saving mode |
| sdio_flow_control_enable | Enable flow control mode |

| | |
|-----------------------------------|---|
| sdio_clock_enable | Enable clock |
| sdio_dma_enable | Enable DMA |
| sdio_interrupt_enable | Enable interrupts |
| sdio_flag_get | Get the flag |
| sdio_flag_clear | Clear the flag |
| sdio_command_config | Configure command argument |
| sdio_command_state_machine_enable | Enable command state machine |
| sdio_command_response_get | Get response command index |
| sdio_response_get | Get card command response |
| sdio_data_config | Configure data paramters |
| sdio_data_state_machine_enable | Enable data state machine |
| sdio_data_counter_get | Get the counter of to-be-sent data |
| sdio_data_read | Read one-WORD data from the receive FIFO |
| sdio_buffer_counter_get | Get the counter of data to be written into BUF or read from BUF |
| sdio_data_write | Write one-WORD data to the transmit FIFO |
| sdio_read_wait_mode_set | Configure read wait mode |
| sdio_read_wait_start | Read wait start |
| sdio_read_wait_stop | Read wait stop |
| sdio_io_function_enable | Enable IO function mode |
| sdio_io_suspend_command_set | Enable suspend command in IO function mode |

5.16.1 sdio_reset function

The table below describes the function sdio_reset.

Table 328. sdio_reset function

| Name | Description |
|------------------------|--|
| Function name | sdio_reset |
| Function prototype | void sdio_reset(sdio_type *sdio_x); |
| Function description | Reset SDIO peripheral registers and control status |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* reset sdio */
sdio_reset(SDIO1);
```

5.16.2 sdio_power_set function

The table below describes the function sdio_power_set.

Table 329. sdio_power_set function

| Name | Description |
|------------------------|--|
| Function name | sdio_power_set |
| Function prototype | void sdio_power_set(sdio_type *sdio_x, sdio_power_state_type power_state); |
| Function description | Configure the controller power status |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | power_state: controller power status |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

power_state

It is used to set the controller power status.

SDIO_POWER_ON: Power ON

SDIO_POWER_OFF: Power OFF

Example:

```
/* sdio power on */
sdio_power_set(SDIO1, SDIO_POWER_ON);
```

5.16.3 sdio_power_status_get function

The table below describes the function sdio_power_status_get.

Table 330. sdio_power_status_get function

| Name | Description |
|------------------------|---|
| Function name | sdio_power_status_get |
| Function prototype | sdio_power_state_type sdio_power_status_get(sdio_type *sdio_x); |
| Function description | Get the controller power status |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | sdio_power_state_type: controller power status |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* check power status */
if(sdio_power_status_get(SDIO1) == SDIO_POWER_OFF)
{
    return SD_REQ_NOT_APPLICABLE;
}
```

5.16.4 sdio_clock_config function

The table below describes the function sdio_clock_config.

Table 331. sdio_clock_config function

| Name | Description |
|------------------------|---|
| Function name | sdio_clock_config |
| Function prototype | void sdio_clock_config(sdio_type *sdio_x, uint16_t clk_div, sdio_edge_phase_type clk_edg); |
| Function description | Configure clock parameters |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | clk_div: clock division, range: 0~0x3FF |
| Input parameter 2 | clk_edg: clock edge configuration |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

clk_edg

Clock edge selection

SDIO_CLOCK_EDGE_RISING: Clock rising edge

SDIO_CLOCK_EDGE_FALLING: Clock falling edge

Example:

```
/* config sdio clock divide and edge phase */
sdio_clock_config(SDIO1, 0x2, SDIO_CLOCK_EDGE_FALLING);
```

5.16.5 sdio_bus_width_config function

The table below describes the function sdio_bus_width_config.

Table 332. sdio_bus_width_config function

| Name | Description |
|------------------------|---|
| Function name | sdio_bus_width_config |
| Function prototype | void sdio_bus_width_config(sdio_type *sdio_x, sdio_bus_width_type width); |
| Function description | Configure bus width |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | width: selected bus width |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

width

Data bus width selection

SDIO_BUS_WIDTH_D1: 1-bit data bus width

SDIO_BUS_WIDTH_D4: 4-bit data bus width

SDIO_BUS_WIDTH_D8: 8-bit data bus width

Example:

```
/* config sdio bus width */
```

```
sdio_bus_width_config(SDIOx, SDIO_BUS_WIDTH_D1);
```

5.16.6 sdio_clock_bypass function

The table below describes the function `sdio_clock_bypass`.

Table 333. `sdio_clock_bypass` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_clock_bypass</code> |
| Function prototype | <code>void sdio_clock_bypass(sdio_type *sdio_x, confirm_state new_state);</code> |
| Function description | Enable clock bypass mode |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>new_state</code> : new state; enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* disable clock bypass */
sdio_clock_bypass(SDIO1, FALSE);
```

5.16.7 sdio_power_saving_mode_enable function

The table below describes the function `sdio_power_saving_mode_enable`.

Table 334. `sdio_power_saving_mode_enable` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_power_saving_mode_enable</code> |
| Function prototype | <code>void sdio_power_saving_mode_enable(sdio_type *sdio_x, confirm_state new_state);</code> |
| Function description | Enable controller power-saving mode |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>new_state</code> : new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* disable power saving mode */
sdio_power_saving_mode_enable(SDIO1, FALSE);
```

5.16.8 sdio_flow_control_enable function

The table below describes the function sdio_flow_control_enable.

Table 335. sdio_flow_control_enable function

| Name | Description |
|------------------------|--|
| Function name | sdio_flow_control_enable |
| Function prototype | void sdio_flow_control_enable(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable flow control mode |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* disable flow control */  
sdio_flow_control_enable(SDIO1, FALSE);
```

5.16.9 sdio_clock_enable function

The table below describes the function sdio_clock_enable.

Table 336. sdio_clock_enable function

| Name | Description |
|------------------------|---|
| Function name | sdio_clock_enable |
| Function prototype | void sdio_clock_enable(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable clock |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable to output sdio_ck */  
sdio_clock_enable(SDIO1, TRUE);
```

5.16.10 sdio_dma_enable function

The table below describes the function sdio_dma_enable.

Table 337. sdio_dma_enable function

| Name | Description |
|------------------------|---|
| Function name | sdio_dma_enable |
| Function prototype | void sdio_dma_enable(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable DMA |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable sdio dma */
sdio_dma_enable(SDIO1, TRUE);
```

5.16.11 sdio_interrupt_enable function

The table below describes the function sdio_interrupt_enable.

Table 338. crm_flag_clear function

| Name | Description |
|------------------------|---|
| Function name | sdio_interrupt_enable |
| Function prototype | void sdio_interrupt_enable(sdio_type *sdio_x, uint32_t int_opt, confirm_state new_state); |
| Function description | Enable interrupts |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | int_opt: selected interrupt type |
| Input parameter 3 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

int_opt

Interrupt type selection

| | |
|----------------------|-------------------------------------|
| SDIO_CMDFAIL_INT: | Command CRC fail interrupt |
| SDIO_DTFAIL_INT: | Data CRC fail interrupt |
| SDIO_CMDTIMEOUT_INT: | Command timeout interrupt |
| SDIO_DTTIMEOUT_INT: | Data timeout interrupt |
| SDIO_TXERRU_INT: | TxBUF underrun error interrupt |
| SDIO_RXERRO_INT: | RxBUF overrun error interrupt |
| SDIO_CMDRSPCMPL_INT: | Command response received interrupt |
| SDIO_CMDCMPL_INT: | Command sent interrupt |
| SDIO_DTCMP_INT: | Data transfer complete interrupt |

| | |
|-----------------------|--|
| SDIO_SBITERR_INT: | Start bit error interrupt |
| SDIO_DTBLOCKCMPL_INT: | Data block transfer complete interrupt |
| SDIO_DOCMD_INT: | Command acting interrupt |
| SDIO_DOTX_INT: | Data transmit acting interrupt |
| SDIO_DORX_INT: | Data receive acting interrupt |
| SDIO_TXBUFH_INT: | TxBUF half empty interrupt |
| SDIO_RXBUFH_INT: | RxBUF half empty interrupt |
| SDIO_TXBUFF_INT: | TxBUF full interrupt |
| SDIO_RXBUFF_INT: | RxBUF full interrupt |
| SDIO_TXBUFE_INT: | TxBUF empty interrupt |
| SDIO_RXBUFE_INT: | RxBUF empty interrupt |
| SDIO_TXBUF_INT: | Data available in TxBUF interrupt |
| SDIO_RXBUF_INT: | Data available in RxBUF interrupt |
| SDIO_SDIOIF_INT: | SD I/O mode received interrupt |

Example:

```
/* disable interrupt */
sdio_interrupt_enable(SDIO1, (SDIO_DTFAIL_INT | SDIO_DTTIMEOUT_INT | \
SDIO_DTCMP_INT | SDIO_TXBUFH_INT | SDIO_RXBUFH_INT | \
SDIO_TXERRU_INT| SDIO_RXERRO_INT | SDIO_SBITERR_INT), FALSE);
```

5.16.12 sdio_flag_get function

The table below describes the function `sdio_flag_get`.

Table 339. `sdio_flag_get` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_flag_get</code> |
| Function prototype | <code>flag_status sdio_flag_get(sdio_type *sdio_x, uint32_t flag);</code> |
| Function description | Get the flag |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as <code>SDIO1</code> |
| Input parameter 2 | <code>flag</code> : selected interrupt type |
| Output parameter | NA |
| Return value | <code>flag_status</code> : flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

Flag selection

| | |
|-----------------------|--------------------------------|
| SDIO_CMDFAIL_FLAG: | Command CRC fail flag |
| SDIO_DTFAIL_FLAG: | Data CRC fail flag |
| SDIO_CMDTIMEOUT_FLAG: | Command timeout flag |
| SDIO_DTTIMEOUT_FLAG: | Data timeout flag |
| SDIO_TXERRU_FLAG: | TxBUF underrun error flag |
| SDIO_RXERRO_FLAG: | RxBUF overrun error flag |
| SDIO_CMDRSPCMPL_FLAG: | Command response received flag |
| SDIO_CMDCMPL_FLAG: | Command sent flag |
| SDIO_DTCMP_FLAG: | Data transfer complete flag |

| | |
|------------------------|-----------------------------------|
| SDIO_SBITERR_FLAG: | Start bit error flag |
| SDIO_DTBLOCKCMPL_FLAG: | Data block transfer complete flag |
| SDIO_DOCMD_FLAG: | Command acting flag |
| SDIO_DOTX_FLAG: | Data transmit acting flag |
| SDIO_DORX_FLAG: | Data receive acting flag |
| SDIO_TXBUFH_FLAG: | TxBUF half-empty flag |
| SDIO_RXBUFH_FLAG: | RxBUF half-empty flag |
| SDIO_TXBUFF_FLAG: | TxBUF full flag |
| SDIO_RXBUFF_FLAG: | RxBUF full flag |
| SDIO_TXBUFE_FLAG: | TxBUF empty flag |
| SDIO_RXBUFE_FLAG: | RxBUF empty flag |
| SDIO_TXBUF_FLAG: | Data available in TxBUF flag |
| SDIO_RXBUF_FLAG: | Data available in RxBUF flag |
| SDIO_SDIOIF_FLAG: | SD I/O mode received flag |

Example:

```
/* check dttimeout flag */
if(sdio_flag_get(SDIOx, SDIO_DTTIMEOUT_FLAG) != RESET)
{
}
```

5.16.13 sdio_interrupt_flag_get function

The table below describes the function `sdio_interrupt_flag_get`.

Table 340. `sdio_interrupt_flag_get` function

| Name | Description |
|------------------------|---|
| Function name | <code>sdio_interrupt_flag_get</code> |
| Function prototype | <code>flag_status sdio_interrupt_flag_get(sdio_type *sdio_x, uint32_t flag);</code> |
| Function description | Check if the selected interrupt flag is set or not |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>flag</code> : selected interrupt type |
| Output parameter | NA |
| Return value | <code>flag_status</code> : flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

Flag selection

| | |
|-----------------------|--------------------------------|
| SDIO_CMDFAIL_FLAG: | Command CRC fail flag |
| SDIO_DTFAIL_FLAG: | Data CRC fail flag |
| SDIO_CMDTIMEOUT_FLAG: | Command timeout flag |
| SDIO_DTTIMEOUT_FLAG: | Data timeout flag |
| SDIO_TXERRU_FLAG: | TxBUF underrun error flag |
| SDIO_RXERRO_FLAG: | RxBUF overrun error flag |
| SDIO_CMDRSPCMPL_FLAG: | Command response received flag |
| SDIO_CMDCMPL_FLAG: | Command sent flag |
| SDIO_DTCMP_FLAG: | Data transfer complete flag |

| | |
|------------------------|-----------------------------------|
| SDIO_SBITERR_FLAG: | Start bit error flag |
| SDIO_DTBLOCKCMPL_FLAG: | Data block transfer complete flag |
| SDIO_DOCMD_FLAG: | Command acting flag |
| SDIO_DOTX_FLAG: | Data transmit acting flag |
| SDIO_DORX_FLAG: | Data receive acting flag |
| SDIO_TXBUFH_FLAG: | TxBUF half-empty flag |
| SDIO_RXBUFH_FLAG: | RxBUF half-empty flag |
| SDIO_TXBUFF_FLAG: | TxBUF full flag |
| SDIO_RXBUFF_FLAG: | RxBUF full flag |
| SDIO_TXBUFE_FLAG: | TxBUF empty flag |
| SDIO_RXBUFE_FLAG: | RxBUF empty flag |
| SDIO_TXBUF_FLAG: | Data available in TxBUF flag |
| SDIO_RXBUF_FLAG: | Data available in RxBUF flag |
| SDIO_SDIOIF_FLAG: | SD I/O mode received flag |

Example

```
/* check dttimeout interrupt flag */
if(sdio_interrupt_flag_get(SDIOx, SDIO_DTTIMEOUT_FLAG) != RESET)
{
}
```

5.16.14 sdio_flag_clear function

The table below describes the function `sdio_flag_clear`.

Table 341. `sdio_flag_clear` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_flag_clear</code> |
| Function prototype | <code>void sdio_flag_clear(sdio_type *sdio_x, uint32_t flag);</code> |
| Function description | Clear flag |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>flag</code> : selected interrupt type |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

Flag selection

| | |
|-----------------------|--------------------------------|
| SDIO_CMDFAIL_FLAG: | Command CRC fail flag |
| SDIO_DTFAIL_FLAG: | Data CRC fail flag |
| SDIO_CMDTIMEOUT_FLAG: | Command timeout flag |
| SDIO_DTTIMEOUT_FLAG: | Data timeout flag |
| SDIO_TXERRU_FLAG: | TxBUF underrun error flag |
| SDIO_RXERRO_FLAG: | RxBUFOVERRUN error flag |
| SDIO_CMDRSPCMPL_FLAG: | Command response received flag |
| SDIO_CMDCMPL_FLAG: | Command transfer complete flag |
| SDIO_DTCMP_FLAG: | Data transfer complete flag |
| SDIO_SBITERR_FLAG: | Start bit error flag |

SDIO_DTBLCMPL_FLAG: Data block transfer complete flag
 SDIO_SDIOIF_FLAG: SD I/O mode received flag

Example:

```
/* clear flags */
#define SDIO_STATIC_FLAGS ((uint32_t)0x000005FF)
sdio_flag_clear(SDIO1, SDIO_STATIC_FLAGS);
```

5.16.15 sdio_command_config function

The table below describes the function sdio_command_config.

Table 342. sdio_command_config function

| Name | Description |
|------------------------|--|
| Function name | sdio_command_config |
| Function prototype | void sdio_command_config(sdio_type *sdio_x, sdio_command_struct_type *command_struct); |
| Function description | Configure command argument |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | command_struct: sdio_command_struct_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

command_struct

sdio_command_struct_type is defined in the at32f413_sdio.h.

typedef struct

```
{
  uint32_t           argument;
  uint8_t            cmd_index;
  sdio_reponse_type rsp_type;
  sdio_wait_type    wait_type;
} sdio_command_struct_type;
```

argument

Command argument is sent to a card as part of a command. It is dependent on the command type.

cmd_index

Command index

rsp_type

Response type, dependent on the command type, including:

SDIO_RESPONSE_NO: No response
 SDIO_RESPONSE_SHORT: Short response
 SDIO_RESPONSE_LONG: Long response

wait_type

Wait type, dependent on the command type, including

SDIO_WAIT_FOR_NO: No wait
 SDIO_WAIT_FOR_INT: Wait for interrupt request
 SDIO_WAIT_FOR_PEND: Wait for end of transfer

Example:

```

/* send cmd16, set block length */
sdio_command_struct_type sdio_command_init_struct;
sdio_command_init_struct.argument = (uint32_t)8;
sdio_command_init_struct.cmd_index = SD_CMD_SET_BLOCKLEN;
sdio_command_init_struct.rsp_type = SDIO_RESPONSE_SHORT;
sdio_command_init_struct.wait_type = SDIO_WAIT_FOR_NO;
/* sdio command config */
sdio_command_config(SDIOx, &sdio_command_init_struct);

```

5.16.16 **sdio_command_state_machine_enable** function

The table below describes the function `sdio_command_state_machine_enable`.

Table 343. `sdio_command_state_machine_enable` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_command_state_machine_enable</code> |
| Function prototype | <code>void sdio_command_state_machine_enable(sdio_type *sdio_x, confirm_state new_state);</code> |
| Function description | Enable command state machine |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>new_state</code> : new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

/* enable ccsm */
sdio_command_state_machine_enable(SDIO1, TRUE);

```

5.16.17 **sdio_command_response_get** function

The table below describes the function `sdio_command_response_get`.

Table 344. `sdio_command_response_get` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_command_response_get</code> |
| Function prototype | <code>uint8_t sdio_command_response_get(sdio_type *sdio_x);</code> |
| Function description | Get response command index |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | <code>uint8_t</code> : response command index |
| Required preconditions | NA |
| Called functions | NA |

Example:

```

/* get response of command index */

```

```
uint8_t rsp_cmd = 0;
rsp_cmd = sdio_command_response_get(SDIO1);
```

5.16.18 sdio_response_get function

The table below describes the function `sdio_response_get`.

Table 345. `sdio_response_get` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_response_get</code> |
| Function prototype | <code>uint32_t sdio_response_get(sdio_type *sdio_x, sdio_rsp_index_type reg_index);</code> |
| Function description | Get card command response |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>reg_index</code> : response register number (1/2/3/4) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

reg_div

Response register selection

`SDIO_RSP1_INDEX`: Response register 1

`SDIO_RSP2_INDEX`: Response register 2

`SDIO_RSP3_INDEX`: Response register 3

`SDIO_RSP4_INDEX`: Response register 4

Example:

```
/* get response register1 */
response = sdio_response_get(SDIO1, SDIO_RSP1_INDEX);
```

5.16.19 sdio_data_config function

The table below describes the function `sdio_data_config`.

Table 346. `sdio_data_config` function

| Name | Description |
|------------------------|--|
| Function name | <code>sdio_data_config</code> |
| Function prototype | <code>void sdio_data_config(sdio_type *sdio_x, sdio_data_struct_type *data_struct);</code> |
| Function description | Configure data parameters |
| Input parameter 1 | <code>sdio_x</code> : selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | <code>data_struct</code> : <code>sdio_data_struct_type</code> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

data_struct

`sdio_data_struct_type` is defined in the `at32f413_sdio.h`.

typedef struct

{

```
    uint32_t           timeout;
    uint32_t           data_length;
    sdio_block_size_type   block_size;
    sdio_transfer_mode_type transfer_mode;
    sdio_transfer_direction_type transfer_direction;
} sdio_data_struct_type;
```

timeout

Data transfer timeout, with the bus clock as the counting base

data_length

Length of the to-be-sent data

block_size

Block size, including

| | |
|------------------------------|-----------|
| SDIO_DATA_BLOCK_SIZE_1B: | 1-bit |
| SDIO_DATA_BLOCK_SIZE_2B: | 2-bit |
| SDIO_DATA_BLOCK_SIZE_4B: | 4-bit |
| SDIO_DATA_BLOCK_SIZE_8B: | 8-bit |
| SDIO_DATA_BLOCK_SIZE_16B: | 16-bit |
| SDIO_DATA_BLOCK_SIZE_32B: | 32-bit |
| SDIO_DATA_BLOCK_SIZE_64B: | 64-bit |
| SDIO_DATA_BLOCK_SIZE_128B: | 128-bit |
| SDIO_DATA_BLOCK_SIZE_256B: | 256-bit |
| SDIO_DATA_BLOCK_SIZE_512B: | 512-bit |
| SDIO_DATA_BLOCK_SIZE_1024B: | 1024-bit |
| SDIO_DATA_BLOCK_SIZE_2048B: | 2048-bit |
| SDIO_DATA_BLOCK_SIZE_4096B: | 4096-bit |
| SDIO_DATA_BLOCK_SIZE_8192B: | 8192-bit |
| SDIO_DATA_BLOCK_SIZE_16384B: | 16384-bit |

transfer_mode

Data transfer mode selection

| | |
|----------------------------|-----------------|
| SDIO_DATA_BLOCK_TRANSFER: | Data block mode |
| SDIO_DATA_STREAM_TRANSFER: | Stream mode |

transfer_direction

Data transfer direction selection

| | |
|-----------------------------------|--------------------|
| SDIO_DATA_TRANSFER_TO_CARD: | Controller-to-card |
| SDIO_DATA_TRANSFER_TO_CONTROLLER: | Card-to-controller |

Example:

```
sdio_data_struct_type sdio_data_init_struct;
sdio_data_init_struct.block_size = SDIO_DATA_BLOCK_SIZE_512B;
sdio_data_init_struct.data_length = 8 ;
sdio_data_init_struct.timeout = SD_DATATIMEOUT ;
sdio_data_init_struct.transfer_direction = SDIO_DATA_TRANSFER_TO_CARD;
sdio_data_init_struct.transfer_mode = SDIO_DATA_BLOCK_TRANSFER;
/* config sdio data */
sdio_data_config(SDIO1, &sdio_data_init_struct);
```

5.16.20 sdio_data_state_machine_enable function

The table below describes the function sdio_data_state_machine_enable.

Table 347. sdio_data_state_machine_enable function

| Name | Description |
|------------------------|--|
| Function name | sdio_data_state_machine_enable |
| Function prototype | void sdio_data_state_machine_enable(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable data state machine |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state; enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable dcsm */
sdio_data_state_machine_enable(SDIO1, TRUE);
```

5.16.21 sdio_data_counter_get function

The table below describes the function sdio_data_counter_get.

Table 348. sdio_data_counter_get function

| Name | Description |
|------------------------|--|
| Function name | sdio_data_counter_get |
| Function prototype | uint32_t sdio_data_counter_get(sdio_type *sdio_x); |
| Function description | Get the counter of to-be-sent data |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint32_t: the counter of to-be-sent data |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get data counter */
uint32_t count = 0;
count = sdio_data_counter_get (SDIO1);
```

5.16.22 sdio_data_read function

The table below describes the function sdio_data_read.

Table 349. sdio_data_read function

| Name | Description |
|------------------------|---|
| Function name | sdio_data_read |
| Function prototype | uint32_t sdio_data_read(sdio_type *sdio_x); |
| Function description | Read one-WORD data from the receive FIFO |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Input parameter 3 | NA |
| Output parameter | NA |
| Return value | uint32_t: one-WORD data |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* read data */
uint32_t data = 0;
data = sdio_data_read(SDIO1);
```

5.16.23 sdio_buffer_counter_get function

The table below describes the function sdio_buffer_counter_get

Table 350. sdio_buffer_counter_get function

| Name | Description |
|------------------------|---|
| Function name | sdio_buffer_counter_get |
| Function prototype | uint32_t sdio_buffer_counter_get(sdio_type *sdio_x); |
| Function description | Get the counter of data to be written into BUF or read from BUF |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* get buffer count */
uint32_t count = 0;
count = sdio_buffer_counter_get(SDIO1);
```

5.16.24 sdio_data_write function

The table below describes the function sdio_data_write.

Table 351. sdio_data_write function

| Name | Description |
|------------------------|---|
| Function name | sdio_data_write |
| Function prototype | void sdio_data_write(sdio_type *sdio_x, uint32_t data); |
| Function description | Write one-WORD data to the transmit FIFO |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* write data */
uint32_t data = 0x11223344;
sdio_data_write(SDIO1, data);
```

5.16.25 sdio_read_wait_mode_set function

The table below describes the function sdio_read_wait_mode_set.

Table 352. sdio_read_wait_mode_set function

| Name | Description |
|------------------------|---|
| Function name | sdio_read_wait_mode_set |
| Function prototype | void sdio_read_wait_mode_set(sdio_type *sdio_x, sdio_read_wait_mode_type mode); |
| Function description | Configure read wait mode |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | mode: read wait mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

mode

SDIO_READ_WAIT_CONTROLLED_BY_D2: Read wait is controlled by DATA Line2

SDIO_READ_WAIT_CONTROLLED_BY_CK: Read wait is controlled by clocke line

Example:

```
/* config read wait mode */
sdio_read_wait_mode_set(SDIO1, SDIO_READ_WAIT_CONTROLLED_BY_D2);
```

5.16.26 sdio_read_wait_start function

The table below describes the function sdio_read_wait_start.

Table 353. sdio_read_wait_start function

| Name | Description |
|------------------------|--|
| Function name | sdio_read_wait_start |
| Function prototype | void sdio_read_wait_start(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Read wait start |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Calling this function indicates start of read wait; when this function is called to disable wait state, it indicates that no action occurs.

Example:

```
/* start read wait mode */
sdio_read_wait_start (SDIO1, TRUE);
```

5.16.27 sdio_read_wait_stop function

The table below describes the function sdio_read_wait_stop.

Table 354. sdio_read_wait_stop function

| Name | Description |
|------------------------|---|
| Function name | sdio_read_wait_stop |
| Function prototype | void sdio_read_wait_stop(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Read wait stop |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Calling this function indicates stop of read wait; when this function is called to disable wait state, it indicates that the read wait is in progress.

Example:

```
/* stop read wait mode */
sdio_read_wait_stop (SDIO1, TRUE);
```

5.16.28 sdio_io_function_enable function

The table below describes the function sdio_io_function_enable.

Table 355. sdio_io_function_enable function

| Name | Description |
|------------------------|---|
| Function name | sdio_io_function_enable |
| Function prototype | void sdio_io_function_enable(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable IO function mode |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable sdio IO mode */
sdio_io_function_enable (SDIO1, TRUE);
```

5.16.29 sdio_io_suspend_command_set function

The table below describes the function sdio_io_suspend_command_set.

Table 356. sdio_io_suspend_command_set function

| Name | Description |
|------------------------|---|
| Function name | sdio_io_suspend_command_set |
| Function prototype | void sdio_io_suspend_command_set(sdio_type *sdio_x, confirm_state new_state); |
| Function description | Enable suspend command in IO function mode |
| Input parameter 1 | sdio_x: selected SDIO peripheral, such as SDIO1 |
| Input parameter 2 | new_state: new state, enabled (TRUE) or disabled (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* send suspend command */
sdio_io_suspend_command_set (SDIO1, TRUE);
```

5.17 Serial peripheral port (SPI)/I²S

The SPI register structure spi_type is defined in the “at32f413_spi.h”.

```
/*
 * @brief type define spi register all
 */
typedef struct
{
    ...
} spi_type;
```

The table below gives a list of the SPI registers.

Table 357. Summary of SPI registers

| Register | Description |
|----------|----------------------------|
| ctrl1 | SPI control register 1 |
| ctrl2 | SPI control register 2 |
| sts | SPI status register |
| dt | SPI data register |
| cpoly | SPI CRC register |
| rcrc | SPI RxCRC register |
| tcrc | SPI TxCRC register |
| i2sctrl | SPI_I2S register |
| i2sclkp | SPI_I2S prescaler register |

The table below gives a list of the SPI library functions.

Table 358. Summary of SPI library functions

| Function name | Description |
|------------------------------------|--|
| spi_i2s_reset | Reset SPI/I ² S registers to their reset values |
| spi_default_para_init | Configure the SPI initialization structure with an initial value |
| spi_init | Initialize SPI |
| spi_crc_next_transmit | Next data transfer is CRC command |
| spi_crc_polynomial_set | SPI CRC polynomial configuration |
| spi_crc_polynomial_get | Get SPI CRC polynomial |
| spi_crc_enable | Enable SPI CRC |
| spi_crc_value_get | Get CRC result of SPI receive/transmit |
| spi_hardware_cs_output_enable | Enable hardware CS output |
| spi_software_cs_internal_level_set | Set software CS internal level |
| spi_frame_bit_num_set | Set the number of frame bits |
| spi_half_duplex_direction_set | Set transfer direction of single-wire bidirectional half-duplex mode |
| spi_enable | Enable SPI |
| i2s_default_para_init | Set an initial value for the I ² S initialization structure |
| i2s_init | Initialize I ² S |
| i2s_enable | Enable I ² S |
| spi_i2s_interrupt_enable | Enable SPI/I ² S interrupts |

| | |
|--------------------------------|--|
| spi_i2s_dma_transmitter_enable | Enable SPI/I ² S DMA transmit |
| spi_i2s_dma_receiver_enable | Enable SPI/I ² S DMA receive |
| spi_i2s_data_transmit | SPI/I ² S transmits data |
| spi_i2s_data_receive | SPI/I ² S receives data |
| spi_i2s_flag_get | Get SPI/I ² S flags |
| spi_i2s_flag_clear | Clear SPI/I ² S flags |

5.17.1 spi_i2s_reset function

The table below describes the function spi_i2s_reset.

Table 359. spi_i2s_reset function

| Name | Description |
|------------------------|---|
| Function name | spi_i2s_reset |
| Function prototype | void spi_i2s_reset(spi_type *spi_x); |
| Function description | Reset SPI/I ² S registers to their reset values |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
spi_i2s_reset (SPI1);
```

5.17.2 spi_default_para_init function

The table below describes the function spi_default_para_init.

Table 360. spi_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | spi_default_para_init |
| Function prototype | void spi_default_para_init(spi_init_type* spi_init_struct); |
| Function description | Set an initial value for the SPI initialization structure |
| Input parameter 1 | spi_init_struct: spi_init_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of spi_init_type before starting. |
| Called functions | NA |

Example:

```
spi_init_type spi_init_struct;  
spi_default_para_init (&spi_init_struct);
```

5.17.3 spi_init function

The table below describes the function spi_init.

Table 361. spi_init function

| Name | Description |
|------------------------|---|
| Function name | spi_init |
| Function prototype | void spi_init(spi_type* spi_x, spi_init_type* spi_init_struct); |
| Function description | Initialize SPI |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | spi_init_struct: <i>spi_init_type</i> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of <i>spi_init_type</i> before starting. |
| Called functions | NA |

The *spi_init_type* is defined in the at32f413_spi.h.

typedef struct

```
{
    spi_transmission_mode_type      transmission_mode;
    spi_master_slave_mode_type     master_slave_mode;
    spi_mclk_freq_div_type        mclk_freq_division;
    spi_first_bit_type            first_bit_transmission;
    spi_frame_bit_num_type        frame_bit_num;
    spi_clock_polarity_type       clock_polarity;
    spi_clock_phase_type          clock_phase;
    spi_cs_mode_type              cs_mode_selection;
}
```

spi_init_type;

spi_transmission_mode

SPI transmission mode selection

| | |
|------------------------------|--|
| SPI_TRANSMIT_FULL_DUPLEX: | Two-wire unidirectional full-duplex mode |
| SPI_TRANSMIT_SIMPLEX_RX: | Two-wire unidirectional receive-only mode |
| SPI_TRANSMIT_HALF_DUPLEX_RX: | Single-wire bidirectional receive-only mode |
| SPI_TRANSMIT_HALF_DUPLEX_TX: | Single-wire bidirectional transmit-only mode |

master_slave_mode

Master/slave mode selection

| | |
|------------------|-------------|
| SPI_MODE_SLAVE: | Slave mode |
| SPI_MODE_MASTER: | Master mode |

mclk_freq_division

Frequency division factor selection

| | |
|------------------|---------------|
| SPI_MCLK_DIV_2: | Divided by 2 |
| SPI_MCLK_DIV_4: | Divided by 4 |
| SPI_MCLK_DIV_8: | Divided by 8 |
| SPI_MCLK_DIV_16: | Divided by 16 |
| SPI_MCLK_DIV_32: | Divided by 32 |
| SPI_MCLK_DIV_64: | Divided by 64 |

SPI_MCLK_DIV_128: Divided by 128

SPI_MCLK_DIV_256: Divided by 256

SPI_MCLK_DIV_512: Divided by 512

SPI_MCLK_DIV_1024: Divided by 1024

first_bit_transmission

SPI MSB-first/LSB-first selection

SPI_FIRST_BIT_MSB: MSB-first

SPI_FIRST_BIT_LSB: LSB-first

frame_bit_num

Set the number of bits in a frame

SPI_FRAME_8BIT: 8-bit data in a frame

SPI_FRAME_16BIT: 16-bit data in a frame

clock_polarity

Select clock polarity

SPI_CLOCK_POLARITY_LOW: Clock output low in idle state

SPI_CLOCK_POLARITY_HIGH: Clock output high in idle state

clock_phase

Select clock phase

SPI_CLOCK_PHASE_1EDGE: Sample on the first clock edge

SPI_CLOCK_PHASE_2EDGE: Sample on the second clock edge

cs_mode_selection

Select CS mode

SPI_CS_HARDWARE_MODE: Hardware CS mode

SPI_CS_SOFTWARE_MODE: Software CS mode

Example:

```
spi_init_type spi_init_struct;
spi_default_para_init(&spi_init_struct);
spi_init_struct.transmission_mode = SPI_TRANSMIT_FULL_DUPLEX;
spi_init_struct.master_slave_mode = SPI_MODE_MASTER;
spi_init_struct.mclk_freq_division = SPI_MCLK_DIV_8;
spi_init_struct.first_bit_transmission = SPI_FIRST_BIT_MSB;
spi_init_struct.frame_bit_num = SPI_FRAME_16BIT;
spi_init_struct.clock_polarity = SPI_CLOCK_POLARITY_LOW;
spi_init_struct.clock_phase = SPI_CLOCK_PHASE_2EDGE;
spi_init_struct.cs_mode_selection = SPI_CS_SOFTWARE_MODE;
spi_init(SPI1, &spi_init_struct);
```

5.17.4 spi_crc_next_transmit function

The table below describes the function spi_crc_next_transmit.

Table 362. spi_crc_next_transmit function

| Name | Description |
|------------------------|---|
| Function name | spi_crc_next_transmit |
| Function prototype | void spi_crc_next_transmit(spi_type* spi_x); |
| Function description | The next data to be sent is CRC command |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
spi_crc_next_transmit (SPI1);
```

5.17.5 spi_crc_polynomial_set function

The table below describes the function spi_crc_polynomial_set.

Table 363. spi_crc_polynomial_set function

| Name | Description |
|------------------------|---|
| Function name | spi_crc_polynomial_set |
| Function prototype | void spi_crc_polynomial_set(spi_type* spi_x, uint16_t crc_poly); |
| Function description | Set SPI CRC polynomial |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | crc_poly: CRC polynomial Value range: 0x0000~0xFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/*set spi crc polynomial value */  
spi_crc_polynomial_set (SPI1, 0x07);
```

5.17.6 spi_crc_polynomial_get function

The table below describes the function spi_crc_polynomial_get.

Table 364. spi_crc_polynomial_get function

| Name | Description |
|------------------------|---|
| Function name | spi_crc_polynomial_get |
| Function prototype | uint16_t spi_crc_polynomial_get(spi_type* spi_x); |
| Function description | Get SPI CRC polynomial |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Output parameter | NA |
| Return value | CRC polynomial Value range: 0x0000~0xFFFF |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/*get spi crc polynomial value */
uint16_t crc_poly;
crc_poly = spi_crc_polynomial_get (SPI1);
```

5.17.7 spi_crc_enable function

The table below describes the function spi_crc_enable.

Table 365. spi_crc_enable function

| Name | Description |
|------------------------|--|
| Function name | spi_crc_enable |
| Function prototype | void spi_crc_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable SPI CRC |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: enabled or disabled This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* spi crc enable */
spi_crc_enable (SPI1, TRUE);
```

5.17.8 spi_crc_value_get function

The table below describes the function spi_crc_value_get.

Table 366. spi_crc_value_get function

| Name | Description |
|------------------------|--|
| Function name | spi_crc_value_get |
| Function prototype | uint16_t spi_crc_value_get(spi_type* spi_x, spi_crc_direction_type crc_direction); |
| Function description | Get SPI receive/transmit CRC result |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>crc_direction</i> : Select receive/transmit CRC |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

crc_direction

Select receive/transmit CRC

SPI_CRC_RX: Receive CRC

SPI_CRC_TX: Transmit CRC

Example:

```
/* get spi rx & tx crc enable */
uint16_t spi_rx_crc, spi_tx_crc;
spi_rx_crc = spi_crc_value_get (SPI1, SPI_CRC_RX);
spi_tx_crc = spi_crc_value_get (SPI1, SPI_CRC_TX);
```

5.17.9 spi_hardware_cs_output_enable function

The table below describes the function spi_hardware_cs_output_enable.

Table 367. spi_hardware_cs_output_enable function

| Name | Description |
|------------------------|---|
| Function name | spi_hardware_cs_output_enable |
| Function prototype | void spi_hardware_cs_output_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable hardware CS output |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: enabled or disabled This parameter can FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | This setting is applicable to SPI master mode only. |
| Called functions | NA |

Example:

```
/* enable the hardware cs output */
```

| |
|---|
| spi_hardware_cs_output_enable (SPI1, TRUE); |
|---|

5.17.10 spi_software_cs_internal_level_set function

The table below describes the function spi_software_cs_internal_level_set.

Table 368. spi_software_cs_internal_level_set function

| Name | Description |
|------------------------|--|
| Function name | spi_software_cs_internal_level_set |
| Function prototype | void spi_software_cs_internal_level_set(spi_type* spi_x, spi_software_cs_level_type level); |
| Function description | Set software CS internal level |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>level</i> : set software CS internal level |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | 1. This setting is applicable to software CS mode only 2. In master mode, the “level” value must be “SPI_SWCS_INTERNAL_LEVEL_HIGHT”. |
| Called functions | NA |

level

Set software CS internal level

SPI_SWCS_INTERNAL_LEVEL_LOW: Software CS internal low level

SPI_SWCS_INTERNAL_LEVEL_HIGHT: Software CS internal high level

Example:

| |
|--|
| /* set the internal level high */ spi_software_cs_internal_level_set (SPI1, SPI_SWCS_INTERNAL_LEVEL_HIGHT); |
|--|

5.17.11 spi_frame_bit_num_set function

The table below describes the function spi_frame_bit_num_set.

Table 369. spi_frame_bit_num_set function

| Name | Description |
|------------------------|--|
| Function name | spi_frame_bit_num_set |
| Function prototype | void spi_frame_bit_num_set(spi_type* spi_x, spi_frame_bit_num_type bit_num); |
| Function description | Set the number of bits in a frame |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>bit_num</i> : Set the number of bits in a frame |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

bit_num

Set the number of bits in a frame

SPI_FRAME_8BIT: 8-bit data in a frame

SPI_FRAME_16BIT: 16-bit data in a frame

Example:

```
/* set the data frame bit num as 8 */  
spi_frame_bit_num_set (SPI1, SPI_FRAME_8BIT);
```

5.17.12 spi_half_duplex_direction_set function

The table below describes the function spi_half_duplex_direction_set.

Table 370. spi_half_duplex_direction_set function

| Name | Description |
|------------------------|---|
| Function name | spi_half_duplex_direction_set |
| Function prototype | void spi_half_duplex_direction_set(spi_type* spi_x, spi_half_duplex_direction_type direction); |
| Function description | Set the transfer direction of single-wire bidirectional half-duplex mode |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>direction</i> : transfer direction |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | This setting is applicable to the single-wire bidirectional half-duplex mode only. |
| Called functions | NA |

direction

Transfer direction

SPI_HALF_DUPLEX_DIRECTION_RX: Receive

SPI_HALF_DUPLEX_DIRECTION_TX: Transmit

Example:

```
/* set the data transmission direction as transmit */  
spi_half_duplex_direction_set (SPI1, SPI_HALF_DUPLEX_DIRECTION_TX);
```

5.17.13 spi_enable function

The table below describes the function spi_enable.

Table 371. spi_enable function

| Name | Description |
|------------------------|--|
| Function name | spi_enable |
| Function prototype | void spi_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable SPI |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: enabled or disabled This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable spi */
spi_enable (SPI1, TRUE);
```

5.17.14 i2s_default_para_init function

The table below describes the function i2s_default_para_init.

Table 372. i2s_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | i2s_default_para_init |
| Function prototype | void i2s_default_para_init(i2s_init_type* i2s_init_struct); |
| Function description | Set an initial value for the I ² S initialization structure |
| Input parameter 1 | i2s_init_struct: <i>spi_i2s_flag</i> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of i2s_init_type before starting. |
| Called functions | NA |

Example:

```
i2s_init_type i2s_init_struct;
i2s_default_para_init (&i2s_init_struct);
```

5.17.15 i2s_init function

The table below describes the function i2s_init.

Table 373. i2s_init function

| Name | Description |
|------------------------|--|
| Function name | i2s_init |
| Function prototype | void i2s_init(spi_type* spi_x, i2s_init_type* i2s_init_struct); |
| Function description | Initialize I ² S |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | i2s_init_struct: <i>spi_i2s_flag</i> pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | It is necessary to define a variable of i2s_init_type before starting. |
| Called functions | NA |

The i2s_init_type is defined in the at32f413_spi.h.

typedef struct

```
{
    i2s_operation_mode_type          operation_mode;
    i2s_audio_protocol_type         audio_protocol;
    i2s_audio_sampling_freq_type    audio_sampling_freq;
    i2s_data_channel_format_type   data_channel_format;
    i2s_clock_polarity_type        clock_polarity;
    confirm_state                   mclk_output_enable;

} i2s_init_type;
```

operation_mode

I²S transfer mode

| | |
|---------------------|---------------------|
| I2S_MODE_SLAVE_TX: | I2S slave transmit |
| I2S_MODE_SLAVE_RX: | I2S slave receive |
| I2S_MODE_MASTER_TX: | I2S master transmit |
| I2S_MODE_MASTER_RX: | I2S master receive |

audio_protocol

I²S audio protocol standards

| | |
|-------------------------------|---------------------------------|
| I2S_AUDIO_PROTOCOL_PHILLIPS: | Phillips |
| I2S_AUDIO_PROTOCOL_MSB: | MSB aligned (left-aligned) |
| I2S_AUDIO_PROTOCOL_LSB: | LSB aligned (right-aligned) |
| I2S_AUDIO_PROTOCOL_PCM_SHORT: | PCM short frame synchronization |
| I2S_AUDIO_PROTOCOL_PCM_LONG: | PCM long frame synchronization |

audio_sampling_freq

I²S audio sampling frequency.

I2S_AUDIO_FREQUENCY_DEFAULT:
Kept at its reset value (sampling frequency changes with SCLK)

| | |
|------------------------------|--------------------------------|
| I2S_AUDIO_FREQUENCY_8K: | I2S sampling frequency 8K |
| I2S_AUDIO_FREQUENCY_11_025K: | I2S sampling frequency 11.025K |
| I2S_AUDIO_FREQUENCY_16K: | I2S sampling frequency 16K |

| | |
|-----------------------------|-------------------------------|
| I2S_AUDIO_FREQUENCY_22_05K: | I2S sampling frequency 22.05K |
| I2S_AUDIO_FREQUENCY_32K: | I2S sampling frequency 32K |
| I2S_AUDIO_FREQUENCY_44_1K: | I2S sampling frequency 44.1K |
| I2S_AUDIO_FREQUENCY_48K: | I2S sampling frequency 48K |
| I2S_AUDIO_FREQUENCY_96K: | I2S sampling frequency 96K |
| I2S_AUDIO_FREQUENCY_192K: | I2S sampling frequency 192K |

data_channel_formatI²S data/channel bits format

| | |
|-------------------------------|-----------------------------|
| I2S_DATA_16BIT_CHANNEL_16BIT: | 16-bit data, 16-bit channel |
| I2S_DATA_16BIT_CHANNEL_32BIT: | 16-bit data, 32-bit channel |
| I2S_DATA_24BIT_CHANNEL_32BIT: | 24-bit data, 32-bit channel |
| I2S_DATA_32BIT_CHANNEL_32BIT: | 32-bit data, 32-bit channel |

clock_polarityI²S clock polarity

| | |
|--------------------------|---------------------------------|
| I2S_CLOCK_POLARITY_LOW: | Clock output low in idle state |
| I2S_CLOCK_POLARITY_HIGH: | Clock output high in idle state |

mclk_output_enable

Enable mclk clock output

This parameter can be FALSE or TRUE.

Example:

```
i2s_init_type i2s_init_struct;
i2s_default_para_init(&i2s_init_struct);
i2s_init_struct.audio_protocol = I2S_AUDIO_PROTOCOL_PHILLIPS;
i2s_init_struct.data_channel_format = I2S_DATA_16BIT_CHANNEL_32BIT;
i2s_init_struct.mclk_output_enable = FALSE;
i2s_init_struct.audio_sampling_freq = I2S_AUDIO_FREQUENCY_48K;
i2s_init_struct.clock_polarity = I2S_CLOCK_POLARITY_LOW;
i2s_init_struct.operation_mode = I2S_MODE_MASTER_TX;
i2s_init(SPI2, &i2s_init_struct);
```

5.17.16 i2s_enable function

The table below describes the function i2s_enable.

Table 374. i2s_enable function

| Name | Description |
|------------------------|---|
| Function name | i2s_enable |
| Function prototype | void i2s_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable I ² S |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: Enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable i2s*/  
i2s_enable (SPI1, TRUE);
```

5.17.17 spi_i2s_interrupt_enable function

The table below describes the function spi_i2s_interrupt_enable.

Table 375. spi_i2s_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_interrupt_enable |
| Function prototype | void spi_i2s_interrupt_enable(spi_type* spi_x, uint32_t spi_i2s_int, confirm_state new_state); |
| Function description | Enable SPI/I ² S interrupts |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>spi_i2s_int</i> : select SPI interrupts |
| Input parameter 3 | new_state: Enable or disable This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

spi_i2s_int

SPI/I²S interrupt selection

SPI_I2S_ERROR_INT: SPI/I²S error interrupts (including CRC error, overflow error, underflow error and mode error)

SPI_I2S_RDBF_INT: Receive data buffer full

SPI_I2S_TDBE_INT: Transmit data buffer empty

Example:

```
/* enable the specified spi/i2s interrupts */  
spi_i2s_interrupt_enable (SPI1, SPI_I2S_ERROR_INT);  
spi_i2s_interrupt_enable (SPI1, SPI_I2S_RDBF_INT);  
spi_i2s_interrupt_enable (SPI1, SPI_I2S_TDBE_INT);
```

5.17.18 spi_i2s_dma_transmitter_enable function

The table below describes the function spi_i2s_dma_transmitter_enable.

Table 376. spi_i2s_dma_transmitter_enable function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_dma_transmitter_enable |
| Function prototype | void spi_i2s_dma_transmitter_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable SPI/I ² S DMA transmitter |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: enabled or disabled This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable spi transmitter dma */
spi_i2s_dma_transmitter_enable (SPI1, TRUE);
```

5.17.19 spi_i2s_dma_receiver_enable function

The table below describes the function spi_i2s_dma_receiver_enable.

Table 377. spi_i2s_dma_receiver_enable function

| Name | Description |
|------------------------|---|
| Function name | spi_i2s_dma_receiver_enable |
| Function prototype | void spi_i2s_dma_receiver_enable(spi_type* spi_x, confirm_state new_state); |
| Function description | Enable SPI/I ² S DMA receiver |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | new_state: enabled or disabled This parameter can be FALSE or TRUE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable spi dma transmitter */
spi_i2s_dma_transmitter_enable (SPI1, TRUE);
```

5.17.20 spi_i2s_data_transmit function

The table below describes the function spi_i2s_data_transmit.

Table 378. spi_i2s_data_transmit function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_data_transmit |
| Function prototype | void spi_i2s_data_transmit(spi_type* spi_x, uint16_t tx_data); |
| Function description | SPI/I ² S sends data |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | tx_data: data to send Value range (for 8-bit bit in a frame): 0x00~0xFF Value range (for 16-bit bit in a frame): 0x0000~0xFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* spi data transmit */
uint16_t tx_data = 0x6666;
spi_i2s_data_transmit (SPI1, tx_data);
```

5.17.21 spi_i2s_data_receive function

The table below describes the function spi_i2s_data_receive.

Table 379. spi_i2s_data_receive function

| Name | Description |
|------------------------|---|
| Function name | spi_i2s_data_receive |
| Function prototype | uint16_t spi_i2s_data_receive(spi_type* spi_x); |
| Function description | SPI/I ² S receives data |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Output parameter | rx_data: data to receive Value range (for 8-bit bit in a frame): 0x00~0xFF Value range (for 16-bit bit in a frame): 0x0000~0xFFFF |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* spi data receive */
uint16_t rx_data = 0;
rx_data = spi_i2s_data_receive (SPI1);
```

5.17.22 spi_i2s_flag_get function

The table below describes the function spi_i2s_flag_get.

Table 380. spi_i2s_flag_get function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_flag_get |
| Function prototype | flag_status spi_i2s_flag_get(spi_type* spi_x, uint32_t spi_i2s_flag); |
| Function description | Get SPI/I ² S flags |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | spi_i2s_flag: flag selection Refer to the "spi_i2s_flag" description below for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

spi_i2s_flag

SPI/I²S is used to select a flag from the optional parameters below:

| | |
|---------------------|--|
| SPI_I2S_RDBF_FLAG: | SPI/I ² S receive data buffer full |
| SPI_I2S_TDBE_FLAG: | SPI/I ² S transmit data buffer empty |
| I2S_ACS_FLAG: | I ² S audio channel state (indicating left/right channel) |
| I2S_TUERR_FLAG: | I ² S transmitter underload error |
| SPI_CCERR_FLAG: | SPI CRC error |
| SPI_MMERR_FLAG: | SPI master mode error |
| SPI_I2S_ROERR_FLAG: | SPI/I ² S receiver overflow error |
| SPI_I2S_BF_FLAG: | SPI/I ² S busy |

Example:

```
/* get receive data buffer full flag */  
flag_status status;  
status = spi_i2s_flag_get(SPI1, SPI_I2S_RDBF_FLAG);
```

5.17.23 spi_i2s_interrupt_flag_get function

The table below describes the function spi_i2s_interrupt_flag_get.

Table 381. spi_i2s_interrupt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_interrupt_flag_get |
| Function prototype | flag_status spi_i2s_interrupt_flag_get(spi_type* spi_x, uint32_t spi_i2s_flag); |
| Function description | Get SPI/I ² S interrupt flag |
| Input parameter 1 | spi_x: : selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | spi_i2s_flag: flag selection Refer to the "spi_i2s_flag" description below for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

spi_i2s_flag

SPI/I²S is used to select a flag from the optional parameters below:

| | |
|---------------------|---|
| SPI_I2S_RDBF_FLAG: | SPI/I ² S receive data buffer full |
| SPI_I2S_TDBE_FLAG: | SPI/I ² S transmit data buffer empty |
| I2S_TUERR_FLAG: | I ² S transmitter underload error |
| SPI_CCERR_FLAG: | SPI CRC error |
| SPI_MMERR_FLAG: | SPI master mode error |
| SPI_I2S_ROERR_FLAG: | SPI/I ² S receiver overflow error |

Example

```
/* get receive data buffer full flag */  
flag_status status;  
status = spi_i2s_interrupt_flag_get(SPI1, SPI_I2S_RDBF_FLAG);
```

5.17.24 spi_i2s_flag_clear function

The table below describes the function spi_i2s_flag_clear.

Table 382. spi_i2s_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | spi_i2s_flag_clear |
| Function prototype | void spi_i2s_flag_clear(spi_type* spi_x, uint32_t spi_i2s_flag) |
| Function description | Clear SPI/I ² S flags |
| Input parameter 1 | spi_x: selected SPI peripheral This parameter can be SPI1 or SPI2. |
| Input parameter 2 | <i>spi_i2s_flag</i> : select a flag to clear Refer to the “spi_i2s_flag” description below for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

spi_i2s_flag:

SPI/I²S is used for flag selection, including:

| | |
|---------------------|---|
| SPI_I2S_RDBF_FLAG: | SPI/I ² S receive data buffer full |
| I2S_TUERR_FLAG: | I ² S transmitter underload error |
| SPI_CCERR_FLAG: | SPI CRC error |
| SPI_MMERR_FLAG: | SPI master mode error |
| SPI_I2S_ROERR_FLAG: | SPI/I ² S receiver overflow error |

Note: The SPI_I2S_TDBE_FLAG (SPI/I2S transmit data buffer empty), I2S_ACS_FLAG (I2S audio channel state) and SPI_I2S_BF_FLAG (SPI/I2S busy) are all set and cleared by hardware to indicate communication state, without the intervention of software.

Example:

```
/* clear receive data buffer full flag */  
spi_i2s_flag_clear (SPI1, SPI_I2S_RDBF_FLAG);
```

5.18 SysTick

The SysTick register structure SysTick_Type is defined in the “core_cm4.h”.

typedef struct

{

...

} SysTick_Type;

The table below gives a list of the SysTick registers.

Table 383. Summary of SysTick registers

| Register | Description |
|----------|--------------------------------|
| ctrl | Control status register |
| load | Reload value register |
| val | Current counter value register |
| calib | Calibration register |

The table below gives a list of the SysTick library functions.

Table 384. Summary of SysTick library functions

| Function name | Description |
|-----------------------------|---|
| systick_clock_source_config | Configure SysTick clock sources |
| SysTick_Config | Configure SysTick counter reload value and interrupts |

5.18.1 systick_clock_source_config function

The table below describes the function systick_clock_source_config.

Table 385. systick_clock_source_config function

| Name | Description |
|------------------------|---|
| Function name | systick_clock_source_config |
| Function prototype | void systick_clock_source_config(systick_clock_source_type source); |
| Function description | Configure SysTick clock source |
| Input parameter 1 | source: systick clock source |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

source

SYSTICK_CLOCK_SOURCE_AHBCLK_DIV8: AHB/8 as SysTick clock

SYSTICK_CLOCK_SOURCE_AHBCLK_NODIV: AHB as SysTick clock

Example:

```
/* config systick clock source */
systick_clock_source_config(SYSTICK_CLOCK_SOURCE_AHBCLK_NODIV);
```

5.18.2 SysTick_Config function

The table below describes the function SysTick_Config.

Table 386. SysTick_Config function

| Name | Description |
|------------------------|--|
| Function name | SysTick_Config |
| Function prototype | uint32_t SysTick_Config(uint32_t ticks); |
| Function description | Configure SysTick counter reload value and enable interrupt |
| Input parameter 1 | ticks: SysTick counter interrupt reload value |
| Input parameter 2 | |
| Output parameter | NA |
| Return value | Return the setting status of this function, success (0) or failure (1) |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* config systick reload value and enable interrupt */  
SysTick_Config(1000);
```

5.19 Timers (TMR)

The TMR register structure tmr_type is defined in the “at32f413_tmr.h”.

```
/*
 * @brief type define tmr register all
 */
typedef struct
{
} tmr_type;
```

The table below gives a list of the TMR registers.

Table 387. Summary of TMR registers

| Register | Description |
|----------|-----------------------------------|
| ctrl1 | TMR control register 1 |
| ctrl2 | TMR control register 2 |
| stctrl | TMR slave timer control register |
| iden | TMR DMA/interrupt enable register |
| ists | TMR interrupt status register |
| swevt | TMR software event register |
| cm1 | TMR channel mode register 1 |
| cm2 | TMR channel mode register 2 |
| cctrl | TMR channel control register |
| cval | TMR counter value register |
| div | TMR divider |
| pr | TMR period register |
| rpr | TMR repetition period register |
| c1dt | TMR channel 1 data register |
| c2dt | TMR channel 2 data register |
| c3dt | TMR channel 3 data register |
| c4dt | TMR channel 4 data register |
| brk | TMR break register |
| dmactrl | TMR DMA control register |
| dmadt | TMR DMA data register |

The table below gives a list of the TMR library functions.

Table 388. Summary of TMR library functions

| Function name | Description |
|------------------------------|--|
| tmr_reset | TMR is reset by CRM reset register |
| tmr_counter_enable | Enable/disable TMR counter |
| tmr_output_default_para_init | Initialize TMR output default parameters |
| tmr_input_default_para_init | Initialize TMR input default parameters |
| tmr_brkdt_default_para_init | Initialize TMR brkdt default parameters |

| | |
|------------------------------------|--|
| tmr_base_init | Initialize TMR period and division |
| tmr_clock_source_div_set | Set TMR clock source frequency division factor |
| tmr_cnt_dir_set | Set TMR counter direction |
| tmr_repetition_counter_set | Set repetition period register |
| tmr_counter_value_set | Set TMR counter value |
| tmr_counter_value_get | Get TMR counter value |
| tmr_div_value_set | Set TMR division value |
| tmr_div_value_get | Get TMR division value |
| tmr_output_channel_config | Configure TMR output channels |
| tmr_output_channel_mode_select | Select TMR output channel mode |
| tmr_period_value_set | Set TMR period value |
| tmr_period_value_get | Get TMR period value |
| tmr_channel_value_set | Set TMR channel value |
| tmr_channel_value_get | Get TMR channel value |
| tmr_period_buffer_enable | Enable/disable TMR periodic buffer |
| tmr_output_channel_buffer_enable | Enable/disable TMR output channel buffer |
| tmr_output_channel_immediately_set | TMR output channel enable immediately |
| tmr_output_channel_switch_set | Set TMR output channel switch |
| tmr_one_cycle_mode_enable | Enable/disable TMR one-cycle mode |
| tmr_32_bit_function_enable | Enable/disable TMR 32-bit function (plus mode) |
| tmr_overflow_request_source_set | Select TMR overflow event source |
| tmr_overflow_event_disable | Enable/disable TMR overflow event generation |
| tmr_input_channel_init | Initialize TMR input channel |
| tmr_channel_enable | Enable/disable TMR channel |
| tmr_input_channel_filter_set | Set TMR input channel filter |
| tmr_pwm_input_config | Configure TMR pwm input |
| tmr_channel1_input_select | Select TMR channel 1 input |
| tmr_input_channel_divider_set | Set TMR input channel divider |
| tmr_primary_mode_select | Select TMR master mode |
| tmr_sub_mode_select | Select TMR slave timer mode |
| tmr_channel_dma_select | Select TMR channel DMA request source |
| tmr_hall_select | Select TMR hall mode |
| tmr_channel_buffer_enable | Enable/disable TMR channel buffer |
| tmr_trigger_input_select | Select TMR slave timer trigger input |
| tmr_sub_sync_mode_set | Set TMR slave timer synchronization mode |
| tmr_dma_request_enable | Enable/disable TMR DMA request |
| tmr_interrupt_enable | Enable/disable TMR interrupt |
| tmr_flag_get | Get TMR flags |
| tmr_flag_clear | Clear TMR flags |
| tmr_event_sw_trigger | Software trigger TMR event |
| tmr_output_enable | Enable/disable TMR output |
| tmr_internal_clock_set | Set TMR internal clock |
| tmr_output_channel_polarity_set | Set TMR output channel polarity |
| tmr_external_clock_config | Set TMR external clock |
| tmr_external_clock_mode1_config | Set TMR external clock mode 1 |

| | |
|---------------------------------|----------------------------------|
| tmr_external_clock_mode2_config | Set TMR external clock mode 2 |
| tmr_encoder_mode_config | Set TMR encoder mode |
| tmr_force_output_set | Set TMR forced output |
| tmr_dma_control_config | Set TMR DMA control |
| tmr_brkdt_config | Set TMR break mode and dead-time |

5.19.1 tmr_reset function

The table below describes the function tmr_reset.

Table 389. tmr_reset function

| Name | Description |
|------------------------|--|
| Function name | tmr_reset |
| Function prototype | void tmr_reset(tmr_type *tmr_x); |
| Function description | TMR is reset by CRM reset register. |
| Input parameter | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset(); |

Example:

```
tmr_reset(TMR1);
```

5.19.2 tmr_counter_enable function

The table below describes the function tmr_counter_enable.

Table 390. tmr_counter_enable function

| Name | Description |
|------------------------|---|
| Function name | tmr_counter_enable |
| Function prototype | void tmr_counter_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR counter |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11 |
| Input parameter 2 | new_state: indicates counter status, ON (TRUE) or OFF (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_counter_enable(TMR1, TRUE);
```

5.19.3 tmr_output_default_para_init function

The table below describes the function tmr_output_default_para_init.

Table 391. tmr_output_default_para_init function

| Name | Description |
|------------------------|---|
| Function name | tmr_output_default_para_init |
| Function prototype | void tmr_output_default_para_init(tmr_output_config_type *tmr_output_struct); |
| Function description | Initialize tmr output default parameters |
| Input parameter | tmr_output_struct: tmr_output_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The table below describes the default values of members of the tmr_output_struct.

Table 392. tmr_output_struct default values

| Member | Default value |
|------------------|------------------------|
| oc_mode | TMR_OUTPUT_CONTROL_OFF |
| oc_idle_state | FALSE |
| occ_idle_state | FALSE |
| oc_polarity | TMR_OUTPUT_ACTIVE_HIGH |
| occ_polarity | TMR_OUTPUT_ACTIVE_HIGH |
| oc_output_state | FALSE |
| occ_output_state | FALSE |

Example:

```
tmr_output_config_type tmr_output_struct;
tmr_output_default_para_init(&tmr_output_struct);
```

5.19.4 tmr_input_default_para_init function

The table below describes the function tmr_input_default_para_init.

Table 393. tmr_input_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | tmr_input_default_para_init |
| Function prototype | void tmr_input_default_para_init(tmr_input_config_type *tmr_input_struct); |
| Function description | Initialize TMR input default parameters |
| Input parameter | tmr_input_struct: tmr_input_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The table below describes the default values of members of the tmr_input_struct.

Table 394. tmr_input_struct default values

| Member | Default value |
|-----------------------|------------------------------|
| input_channel_select | TMR_SELECT_CHANNEL_1 |
| input_polarity_select | TMR_INPUT_RISING_EDGE |
| input_mapped_select | TMR_CC_CHANNEL_MAPPED_DIRECT |
| input_filter_value | 0x0 |

Example:

```
tmr_input_config_type tmr_input_struct;
tmr_input_default_para_init(&tmr_input_struct);
```

5.19.5 tmr_brkdt_default_para_init function

The table below describes the function tmr_brkdt_default_para_init.

Table 395. tmr_brkdt_default_para_init function

| Name | Description |
|------------------------|--|
| Function name | tmr_brkdt_default_para_init |
| Function prototype | void tmr_brkdt_default_para_init(tmr_brkdt_config_type *tmr_brkdt_struct); |
| Function description | Initialize TMR brkdt default parameters |
| Input parameter | tmr_brkdt_struct: tmr_brkdt_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

The table below describes the default values of members of the tmr_brkdt_struct.

Table 396. tmr_brkdt_struct default values

| Member | Default value |
|--------------------|--------------------------|
| deadtime | 0x0 |
| brk_polarity | TMR_BRK_INPUT_ACTIVE_LOW |
| wp_level | TMR_WP_OFF |
| auto_output_enable | FALSE |
| fcsoen_state | FALSE |
| fcsdis_state | FALSE |
| brk_enable | FALSE |

Example:

```
tmr_brkdt_config_type tmr_brkdt_struct;
tmr_brkdt_default_para_init(&tmr_brkdt_struct);
```

5.19.6 tmr_base_init function

The table below describes the function tmr_base_init

Table 397. tmr_base_init function

| Name | Description |
|------------------------|--|
| Function name | tmr_base_init |
| Function prototype | void tmr_base_init(tmr_type* tmr_x, uint32_t tmr_pr, uint32_t tmr_div); |
| Function description | Initialize TMR period and division |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_pr: timer period value, 0x0000~0xFFFF for 16-bit timer, and 0x0000_0000~0xFFFF_FFFF for 32-bit timer |
| Input parameter 3 | tmr_div: timer division value, 0x0000~0xFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_base_init(TMR1, 0xFFFF, 0xFFFF);
```

5.19.7 tmr_clock_source_div_set function

The table below describes the function tmr_clock_source_div_set.

Table 398. tmr_clock_source_div_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_clock_source_div_set |
| Function prototype | void tmr_clock_source_div_set(tmr_type *tmr_x, tmr_clock_division_type tmr_clock_div); |
| Function description | Set TMR clock source division |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_clock_div: timer clock source frequency division factor |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_clock_div

Select TMR clock source frequency division factor

TMR_CLOCK_DIV1: Divided by 1

TMR_CLOCK_DIV2: Divided by 2

TMR_CLOCK_DIV4: Divided by 4

Example:

```
tmr_clock_source_div_set(TMR1, TMR_CLOCK_DIV4);
```

5.19.8 tmr_cnt_dir_set function

The table below describes the function tmr_cnt_dir_set.

Table 399. tmr_cnt_dir_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_cnt_dir_set |
| Function prototype | void tmr_cnt_dir_set(tmr_type *tmr_x, tmr_count_mode_type tmr_cnt_dir); |
| Function description | Set TMR counter direction |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_cnt_dir: timer counting direction |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_cnt_dir

Select timer counting direction.

TMR_COUNT_UP:

Up counting

TMR_COUNT_DOWN:

Down counting

TMR_COUNT_TWO_WAY_1:

Center-aligned mode (up/down counting) 1

TMR_COUNT_TWO_WAY_2:

Center-aligned mode (up/down counting)2

TMR_COUNT_TWO_WAY_3:

Center-aligned mode (up/down counting)3

Example:

```
tmr_cnt_dir_set(TMR1, TMR_COUNT_UP);
```

5.19.9 tmr_repetition_counter_set function

The table below describes the function tmr_repetition_counter_set.

Table 400. tmr_repetition_counter_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_repetition_counter_set |
| Function prototype | void tmr_repetition_counter_set(tmr_type *tmr_x, uint8_t tmr_rpr_value); |
| Function description | Set repetition period register (rpr) |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1 or TMR8. |
| Input parameter 2 | tmr_rpr_value: timer repetition period value, 0x00~0xFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_repetition_counter_set(TMR1, 0x10);
```

5.19.10 tmr_counter_value_set function

The table below describes the function tmr_counter_value_set.

Table 401. tmr_counter_value_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_counter_value_set |
| Function prototype | void tmr_counter_value_set(tmr_type *tmr_x, uint32_t tmr_cnt_value); |
| Function description | Set TMR counter value |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_cnt_value: timer counter value, 0x0000~0xFFFF for 16-bit timer, and 0x0000_0000~0xFFFF_FFFF for 32-bit timer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_counter_value_set(TMR1, 0xFFFF);
```

5.19.11 tmr_counter_value_get function

The table below describes the function tmr_counter_value_get.

Table 402. tmr_counter_value_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_counter_value_get |
| Function prototype | uint32_t tmr_counter_value_get(tmr_type *tmr_x); |
| Function description | Get TMR counter value |
| Input parameter | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Output parameter | NA |
| Return value | Timer counter value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t counter_value;
counter_value = tmr_counter_value_get(TMR1);
```

5.19.12 tmr_div_value_set function

The table below describes the function tmr_div_value_set.

Table 403. tmr_div_value_set function

| Name | Description |
|------------------------|---|
| Function name | tmr_div_value_set |
| Function prototype | void tmr_div_value_set(tmr_type *tmr_x, uint32_t tmr_div_value); |
| Function description | Set TMR frequency division value |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_div_value: timer frequency division value, 0x0000~0xFFFF for 16-bit timer, and 0x0000_0000~0xFFFF_FFFF for 32-bit timer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_div_value_set(TMR1, 0xFFFF);
```

5.19.13 tmr_div_value_get function

The table below describes the function tmr_div_value_get.

Table 404. tmr_div_value_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_div_value_get |
| Function prototype | uint32_t tmr_div_value_get(tmr_type *tmr_x); |
| Function description | Get TMR frequency division value |
| Input parameter | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Output parameter | NA |
| Return value | Timer frequency division value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t div_value;
div_value = tmr_div_value_get(TMR1);
```

5.19.14 tmr_output_channel_config function

The table below describes the function tmr_output_channel_config.

Table 405. tmr_output_channel_config function

| Name | Description |
|------------------------|--|
| Function name | tmr_output_channel_config |
| Function prototype | void tmr_output_channel_config(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, tmr_output_config_type *tmr_output_struct); |
| Function description | Configure TMR output channels |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | tmr_output_struct: tmr_output_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Channel 1
- TMR_SELECT_CHANNEL_2: Channel 2
- TMR_SELECT_CHANNEL_3: Channel 3
- TMR_SELECT_CHANNEL_4: Channel 4

tmr_output_config_type structure

tmr_output_config_type is defined in the at32f413_tmr.h.

typedef struct

```
{
    tmr_output_control_mode_type      oc_mode;
    confirm_state                     oc_idle_state;
    confirm_state                     occ_idle_state;
    tmr_output_polarity_type         oc_polarity;
    tmr_output_polarity_type         occ_polarity;
    confirm_state                     oc_output_state;
    confirm_state                     occ_output_state;
} tmr_output_config_type;
```

oc_mode

Set output channel mode, that is, to configure channel original signals (CxORAW).

- TMR_OUTPUT_CONTROL_OFF: Disconnect channel output (CxOUT) from CxORAW
- TMR_OUTPUT_CONTROL_HIGH: CxORAW high
- TMR_OUTPUT_CONTROL_LOW: CxORAW low
- TMR_OUTPUT_CONTROL_SWITCH: Switch CxORAW level
- TMR_OUTPUT_CONTROL_FORCE_LOW: CxORAW forced low
- TMR_OUTPUT_CONTROL_FORCE_HIGH: CxORAW forced high
- TMR_OUTPUT_CONTROL_PWM_MODE_A: PWM mode A
- TMR_OUTPUT_CONTROL_PWM_MODE_B: PWM mode B

oc_idle_state

Set output channel idle state

FALSE: Output channel idle state is 0

TRUE: Output channel idle state is 1

occ_idle_state

Set complementary output channel idle state

FALSE: Complementary output channel idle state is 0

TRUE: Complementary output channel idle state is 1

oc_polarity

Set the polarity of output channels

TMR_OUTPUT_ACTIVE_HIGH: Active high

TMR_OUTPUT_ACTIVE_LOW: Active low

occ_polarity

Set the polarity of complementary output channels

TMR_OUTPUT_ACTIVE_HIGH: Active high

TMR_OUTPUT_ACTIVE_LOW: Active low

oc_output_state

Set the state of output channels

FALSE: Output channel OFF

TRUE: Output channel ON

occ_output_state

Set the state of complementary output channels

FALSE: Complementary output channel OFF

TRUE: Complementary output channel ON

Example:

```
tmr_output_config_type tmr_output_struct;
tmr_output_struct.oc_mode = TMR_OUTPUT_CONTROL_OFF;
tmr_output_struct.oc_output_state = TRUE;
tmr_output_struct.oc_polarity = TMR_OUTPUT_ACTIVE_HIGH;
tmr_output_struct.oc_idle_state = TRUE;
tmr_output_struct.occ_output_state = TRUE;
tmr_output_struct.occ_polarity = TMR_OUTPUT_ACTIVE_HIGH;
tmr_output_struct.occ_idle_state = TRUE;
tmr_output_channel_config(TMR1, TMR_SELECT_CHANNEL_1, &tmr_output_struct);
```

5.19.15 tmr_output_channel_mode_select function

The table below describes the function tmr_output_channel_mode_select.

Table 406. tmr_output_channel_mode_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_output_channel_mode_select |
| Function prototype | void tmr_output_channel_mode_select(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, tmr_output_control_mode_type oc_mode); |
| Function description | Select TMR output channel mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | oc_mode: output mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

oc_mode

Set output channel mode, that is, to configure channel original signals (CxORAW).

- TMR_OUTPUT_CONTROL_OFF: Disconnect channel output (CxOUT) from CxORAW
- TMR_OUTPUT_CONTROL_HIGH: CxORAW high
- TMR_OUTPUT_CONTROL_LOW: CxORAW low
- TMR_OUTPUT_CONTROL_SWITCH: Switch CxORAW level
- TMR_OUTPUT_CONTROL_FORCE_LOW: CxORAW forced low
- TMR_OUTPUT_CONTROL_FORCE_HIGH: CxORAW forced high
- TMR_OUTPUT_CONTROL_PWM_MODE_A: PWM mode A
- TMR_OUTPUT_CONTROL_PWM_MODE_B: PWM mode B

Example:

```
tmr_output_channel_mode_select(TMR1, TMR_SELECT_CHANNEL_1, TMR_OUTPUT_CONTROL_SWITCH);
```

5.19.16 tmr_period_value_set function

The table below describes the function tmr_period_value_set.

Table 407. tmr_period_value_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_period_value_set |
| Function prototype | void tmr_period_value_set(tmr_type *tmr_x, uint32_t tmr_pr_value); |
| Function description | Set TMR period value |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_pr_value: timer period value, 0x0000~0xFFFF for 16-bit timer, and 0x0000_0000~0xFFFF_FFFF for 32-bit timer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_period_value_set(TMR1, 0xFFFF);
```

5.19.17 tmr_period_value_get function

The table below describes the function tmr_period_value_get.

Table 408. tmr_period_value_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_period_value_get |
| Function prototype | uint32_t tmr_period_value_get(tmr_type *tmr_x); |
| Function description | Get TMR period value |
| Input parameter | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Output parameter | NA |
| Return value | Timer period value |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
uint32_t pr_value;  
pr_value = tmr_period_value_get(TMR1);
```

5.19.18 tmr_channel_value_set function

The table below describes the function tmr_channel_value_set.

Table 409. tmr_channel_value_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_channel_value_set |
| Function prototype | void tmr_channel_value_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, uint32_t tmr_channel_value); |
| Function description | Set TMR channel value |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | tmr_channel_value: timer channel value, 0x0000~0xFFFF for 16-bit timer, and 0x0000_0000~0xFFFF_FFFF for 32-bit timer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_channel_value_set(TMR1, TMR_SELECT_CHANNEL_1, 0xFFFF);
```

5.19.19 tmr_channel_value_get function

The table below describes the function tmr_channel_value_get.

Table 410. tmr_channel_value_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_channel_value_get |
| Function prototype | uint32_t tmr_channel_value_get(tmr_type *tmr_x, tmr_channel_select_type tmr_channel); |
| Function description | Get TMR channel value |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Output parameter | Timer channel value |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- | | |
|-----------------------|-----------------|
| TMR_SELECT_CHANNEL_1: | Timer channel 1 |
| TMR_SELECT_CHANNEL_2: | Timer channel 2 |
| TMR_SELECT_CHANNEL_3: | Timer channel 3 |
| TMR_SELECT_CHANNEL_4: | Timer channel 4 |

Example:

```
uint32_t ch_value;
ch_value = tmr_channel_value_get(TMR1, TMR_SELECT_CHANNEL_1);
```

5.19.20 tmr_period_buffer_enable function

The table below describes the function tmr_period_buffer_enable.

Table 411. tmr_period_buffer_enable function

| Name | Description |
|------------------------|---|
| Function name | tmr_period_buffer_enable |
| Function prototype | void tmr_period_buffer_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR period buffer |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | new_state: indicates the status of period buffer. It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_period_buffer_enable(TMR1, TRUE);
```

5.19.21 tmr_output_channel_buffer_enable function

The table below describes the function tmr_output_channel_buffer_enable.

Table 412. tmr_output_channel_buffer_enable function

| Name | Description |
|----------------------|---|
| Function name | tmr_output_channel_buffer_enable |
| Function prototype | void tmr_output_channel_buffer_enable(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, confirm_state new_state); |
| Function description | Enable or disable TMR output channel buffer |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | new_state: indicates the status of output channel buffer; enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |

| Name | Description |
|------------------------|-------------|
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_output_channel_buffer_enable(TMR1, TMR_SELECT_CHANNEL_1, TRUE);
```

5.19.22 tmr_output_channel_immediately_set function

The table below describes the function tmr_output_channel_immediately_set.

Table 413. tmr_output_channel_immediately_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_output_channel_immediately_set |
| Function prototype | void tmr_output_channel_immediately_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, confirm_state new_state); |
| Function description | Enable TMR output channel immediately |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | new_state: indicates the status of output channel enable. This parameter can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_output_channel_immediately_set(TMR1, TMR_SELECT_CHANNEL_1, TRUE);
```

5.19.23 tmr_output_channel_switch_set function

The table below describes the function tmr_output_channel_switch_set.

Table 414. tmr_output_channel_switch_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_output_channel_switch_set |
| Function prototype | void tmr_output_channel_switch_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, confirm_state new_state); |
| Function description | Set TMR output channel switch |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | new_state: indicates the status of output channel switch. This parameter can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_output_channel_switch_set(TMR1, TMR_SELECT_CHANNEL_1, TRUE);
```

5.19.24 tmr_one_cycle_mode_enable function

The table below describes the function tmr_one_cycle_mode_enable.

Table 415. tmr_one_cycle_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | tmr_one_cycle_mode_enable |
| Function prototype | void tmr_one_cycle_mode_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR one-cycle mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | new_state: indicates the status of one-cycle mode. This parameter can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|--|
| tmr_one_cycle_mode_enable(TMR1, TRUE); |
|--|

5.19.25 tmr_32_bit_function_enable function

The table below describes the function tmr_32_bit_function_enable.

Table 416. tmr_32_bit_function_enable function

| Name | Description |
|------------------------|---|
| Function name | tmr_32_bit_function_enable |
| Function prototype | void tmr_32_bit_function_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR 32-bit feature (plus mode) |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR2 or TMR5. |
| Input parameter 2 | new_state: the status of 32-bit mode This parameter can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|---|
| tmr_32_bit_function_enable(TMR2, TRUE); |
|---|

5.19.26 tmr_overflow_request_source_set function

The table below describes the function tmr_overflow_request_source_set.

Table 417. tmr_overflow_request_source_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_overflow_request_source_set |
| Function prototype | void tmr_overflow_request_source_set(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Select TMR overflow event sources |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | new_state: indicates the overflow event source |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

new_state

Select an overflow event source

FALSE: Counter overflow, OVFSWTR being set, overflow event from slave mode timer controller

TRUE: Counter overflow only

Example:

| |
|--|
| tmr_overflow_request_source_set(TMR1, TRUE); |
|--|

5.19.27 tmr_overflow_event_disable function

The table below describes the function tmr_overflow_event_disable.

Table 418. tmr_overflow_event_disable function

| Name | Description |
|------------------------|--|
| Function name | tmr_overflow_event_disable |
| Function prototype | void tmr_overflow_event_disable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR overflow event generation |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | new_state: indicates the status of overflow event generation |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

new_state

Select the status of overflow event generation

FALSE: Enable overflow event generation, which can be generated from the following:

- Counter overflow
- Set OVFSWTR=1
- Overflow event from slave mode timer controller

TRUE: Disable overflow event generation

Example:

```
tmr_overflow_event_disable(TMR1, TRUE);
```

5.19.28 tmr_input_channel_init function

The table below describes the function tmr_input_channel_init.

Table 419. tmr_input_channel_init function

| Name | Description |
|------------------------|---|
| Function name | tmr_input_channel_init |
| Function prototype | void tmr_input_channel_init(tmr_type *tmr_x, tmr_input_config_type *input_struct, tmr_channel_input_divider_type divider_factor); |
| Function description | Initialize TMR input channels |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | input_struct: tmr_input_config_type pointer |
| Input parameter 3 | divider_factor: input channel frequency division factor |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_input_config_type structure

tmr_input_config_type is defined in the at32f413_tmr.h.

typedef struct

```
{  
    tmr_channel_select_type      input_channel_select;  
    tmr_input_polarity_type      input_polarity_select;  
    tmr_input_direction_mapped_type input_mapped_select;  
    uint8_t                      input_filter_value;  
} tmr_input_config_type;
```

input_channel_select

Select a TMR input channel

| | |
|-----------------------|-----------------|
| TMR_SELECT_CHANNEL_1: | Timer channel 1 |
| TMR_SELECT_CHANNEL_2: | Timer channel 2 |
| TMR_SELECT_CHANNEL_3: | Timer channel 3 |
| TMR_SELECT_CHANNEL_4: | Timer channel 4 |

input_polarity_select

Select the polarity of input channels

| | |
|-------------------------|---|
| TMR_INPUT_RISING_EDGE: | Rising edge |
| TMR_INPUT_FALLING_EDGE: | Falling edge |
| TMR_INPUT_BOTH_EDGE: | Both edges (Rising edge and Falling edge) |

input_mapped_select

Select input channel mapping

TMR_CC_CHANNEL_MAPPED_DIRECT:

TMR input channel 1,2,3 and 4 are linked to C1IRAW, C2IRAW, C3IRAW and C4IRAW respectively.

TMR_CC_CHANNEL_MAPPED_INDIRECT:

TMR input channel 1,2,3 and 4 are linked to C2IRAW, C1IRAW, C4IRAW and C3IRAW respectively.

TMR_CC_CHANNEL_MAPPED_STI:

TMR input channel is mapped on STI

input_filter_value

Select an input channel filter value, ranging from 0x00 to 0x0F

divider_factor

Select input channel frequency division factor

| | |
|--------------------------|--------------|
| TMR_CHANNEL_INPUT_DIV_1: | Divided by 1 |
| TMR_CHANNEL_INPUT_DIV_2: | Divided by 2 |
| TMR_CHANNEL_INPUT_DIV_4: | Divided by 4 |
| TMR_CHANNEL_INPUT_DIV_8: | Divided by 8 |

Example:

```
tmr_input_config_type tmr_input_config_struct;  
tmr_input_config_struct.input_channel_select = TMR_SELECT_CHANNEL_2;  
tmr_input_config_struct.input_mapped_select = TMR_CC_CHANNEL_MAPPED_DIRECT;  
tmr_input_config_struct.input_polarity_select = TMR_INPUT_RISING_EDGE;  
tmr_input_config_struct.input_filter_value = 0x00;  
tmr_input_channel_init(TMR1, &tmr_input_config_struct, TMR_CHANNEL_INPUT_DIV_1);
```

5.19.29 tmr_channel_enable function

The table below describes the function tmr_channel_enable.

Table 420. tmr_channel_enable function

| Name | Description |
|------------------------|--|
| Function name | tmr_channel_enable |
| Function prototype | void tmr_channel_enable(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, confirm_state new_state); |
| Function description | Enable or disable TMR channels |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | new_state: indicates the status of timer channel. It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Set TMR channel.

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_1C: Complementary channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_2C: Complementary channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_3C: Complementary channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_channel_enable(TMR1, TMR_SELECT_CHANNEL_1, TRUE);
```

5.19.30 tmr_input_channel_filter_set function

The table below describes the function tmr_input_channel_filter_set.

Table 421. tmr_input_channel_filter_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_input_channel_filter_set |
| Function prototype | void tmr_input_channel_filter_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, uint16_t filter_value); |
| Function description | Set TMR input channel filter |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | filter_value: set channel filter value, 0x00~0x0F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Set TMR channel.

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

Example:

```
tmr_input_channel_filter_set(TMR1, TMR_SELECT_CHANNEL_1, 0x0F);
```

5.19.31 tmr_pwm_input_config function

The table below describes the function tmr_pwm_input_config.

Table 422. tmr_pwm_input_config function

| Name | Description |
|------------------------|---|
| Function name | tmr_pwm_input_config |
| Function prototype | void tmr_pwm_input_config(tmr_type *tmr_x, tmr_input_config_type *input_struct, tmr_channel_input_divider_type divider_factor); |
| Function description | Configure TMR pwm input |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | input_struct: tmr_input_config_type pointer |
| Input parameter 3 | divider_factor: input channel frequency division factor |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

input_struct

tmr_input_config_type pointer; refer to
[tmr_input_config_type](#) for details.

divider_factor

Select input channel frequency division factor.

TMR_CHANNEL_INPUT_DIV_1: Divided by 1

TMR_CHANNEL_INPUT_DIV_2: Divided by 2

TMR_CHANNEL_INPUT_DIV_4: Divided by 4

TMR_CHANNEL_INPUT_DIV_8: Divided by 8

Example:

```
tmr_input_config_type tmr_ic_init_structure;
tmr_ic_init_structure.input_filter_value = 0;
tmr_ic_init_structure.input_channel_select = TMR_SELECT_CHANNEL_2;
tmr_ic_init_structure.input_mapped_select = TMR_CC_CHANNEL_MAPPED_DIRECT;
tmr_ic_init_structure.input_polarity_select = TMR_INPUT_RISING_EDGE;
tmr_pwm_input_config(TMR1, &tmr_ic_init_structure, TMR_CHANNEL_INPUT_DIV_1);
```

5.19.32 tmr_channel1_input_select function

The table below describes the function tmr_channel1_input_select.

Table 423. tmr_channel1_input_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_channel1_input_select |
| Function prototype | void tmr_channel1_input_select(tmr_type *tmr_x, tmr_channel1_input_connected_type ch1_connect); |
| Function description | Select TMR channel 1 input |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | ch1_connect: channel 1 input selection |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

ch1_connect

Select channel 1 input

TMR_CHANNEL1_CONNECTED_C1IRAW: CH1 pin is connected to C1IRAW

TMR_CHANNEL1_2_3_CONNECTED_C1IRAW_XOR: Connect XOR results CH1, CH2 and CH3 pins to C1IRAW

Example:

```
tmr_channel1_input_select(TMR1, TMR_CHANNEL1_2_3_CONNECTED_C1IRAW_XOR);
```

5.19.33 tmr_input_channel_divider_set function

The table below describes the function tmr_input_channel_divider_set.

Table 424. tmr_input_channel_divider_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_input_channel_divider_set |
| Function prototype | void tmr_input_channel_divider_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, tmr_channel_input_divider_type divider_factor); |
| Function description | Set TMR input channel divider |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | divider_factor: input channel frequency division factor |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel.

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

divider_factor

Select input channel frequency division factor.

- TMR_CHANNEL_INPUT_DIV_1: Divided by 1
- TMR_CHANNEL_INPUT_DIV_2: Divided by 2
- TMR_CHANNEL_INPUT_DIV_4: Divided by 4
- TMR_CHANNEL_INPUT_DIV_8: Divided by 8

Example:

```
tmr_input_channel_divider_set(TMR1, TMR_SELECT_CHANNEL_1, TMR_CHANNEL_INPUT_DIV_2);
```

5.19.34 tmr_primary_mode_select function

The table below describes the function tmr_primary_mode_select.

Table 425. tmr_primary_mode_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_primary_mode_select |
| Function prototype | void tmr_primary_mode_select(tmr_type *tmr_x, tmr_primary_select_type primary_mode); |
| Function description | Select TMR primary (master) mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | primary_mode: master mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |

| Name | Description |
|------------------|-------------|
| Called functions | NA |

primary_mode

Select primary mode, that is, master timer output signal selection.

| | |
|---------------------------|---------------|
| TMR_PRIMARY_SEL_RESET: | Reset |
| TMR_PRIMARY_SEL_ENABLE: | Enable |
| TMR_PRIMARY_SEL_OVERFLOW: | Overflow |
| TMR_PRIMARY_SEL_COMPARE: | Compare pulse |
| TMR_PRIMARY_SEL_C1ORAW: | C1ORAW |
| TMR_PRIMARY_SEL_C2ORAW: | C2ORAW |
| TMR_PRIMARY_SEL_C3ORAW: | C3ORAW |
| TMR_PRIMARY_SEL_C4ORAW: | C4ORAW |

Example:

```
tmr_primary_mode_select(TMR1, TMR_PRIMARY_SEL_RESET);
```

5.19.35 tmr_sub_mode_select function

The table below describes the function tmr_sub_mode_select.

Table 426. tmr_sub_mode_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_sub_mode_select |
| Function prototype | void tmr_sub_mode_select(tmr_type *tmr_x, tmr_sub_mode_select_type sub_mode); |
| Function description | Select TMR slave timer mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8 or TMR9. |
| Input parameter 2 | sub_mode: slave timer mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

primary_mode

Select slave timer modes.

| | |
|--------------------------------|------------------|
| TMR_SUB_MODE_DISABLE: | Disable |
| TMR_SUB_ENCODER_MODE_A: | Encoder mode A |
| TMR_SUB_ENCODER_MODE_B: | Encoder mode B |
| TMR_SUB_ENCODER_MODE_C: | Encoder mode C |
| TMR_SUB_RESET_MODE: | Reset |
| TMR_SUB_HANG_MODE: | Suspend |
| TMR_SUB_TRIGGER_MODE: | Trigger |
| TMR_SUB_EXTERNAL_CLOCK_MODE_A: | External clock A |

Example:

```
tmr_sub_mode_select(TMR1, TMR_SUB_HANG_MODE);
```

5.19.36 tmr_channel_dma_select function

The table below describes the function tmr_channel_dma_select.

Table 427. tmr_channel_dma_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_channel_dma_select |
| Function prototype | void tmr_channel_dma_select(tmr_type *tmr_x, tmr_dma_request_source_type cc_dma_select); |
| Function description | Select TMR channel DMA request source |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8 or TMR9. |
| Input parameter 2 | cc_dma_select: TMR channel DMA request source |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

cc_dma_select

Select DMA request source for TMR channels.

TMR_DMA_REQUEST_BY_CHANNEL: DMA request upon a channel event (CxIF = 1)

TMR_DMA_REQUEST_BY_OVERFLOW: DMA request upon an overflow event (OVFIF = 1)

Example:

```
tmr_channel_dma_select(TMR1, TMR_DMA_REQUEST_BY_OVERFLOW);
```

5.19.37 tmr_hall_select function

The table below describes the function tmr_hall_select.

Table 428. tmr_hall_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_hall_select |
| Function prototype | void tmr_hall_select(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Select TMR hall mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1 or TMR8. |
| Input parameter 2 | new_state: indicates the status of TMR hall mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

new_state

Select the status of TMR hall mode in order to refresh channel control bit.

FALSE: Refresh channel control bit through HALL

TRUE: Refresh channel control bit through HALL or the rising edge of TRGIN

Example:

```
tmr_hall_select(TMR1, TRUE);
```

5.19.38 tmr_channel_buffer_enable function

The table below describes the function tmr_channel_buffer_enable.

Table 429. tmr_channel_buffer_enable function

| Name | Description |
|------------------------|---|
| Function name | tmr_channel_buffer_enable |
| Function prototype | void tmr_channel_buffer_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR channel buffer |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1 or TMR8. |
| Input parameter 2 | new_state: indicates the status of TMR channel buffer. It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|--|
| tmr_channel_buffer_enable(TMR1, TRUE); |
|--|

5.19.39 tmr_trigger_input_select function

The table below describes the function tmr_trigger_input_select.

Table 430. tmr_trigger_input_select function

| Name | Description |
|------------------------|--|
| Function name | tmr_trigger_input_select |
| Function prototype | void tmr_trigger_input_select(tmr_type *tmr_x, sub_tmr_input_sel_type trigger_select); |
| Function description | Select TMR slave timer trigger input |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8 or TMR9. |
| Input parameter 2 | trigger_select: TMR slave timer trigger input |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

trigger_select

Select TMR slave timer trigger input.

- TMR_SUB_INPUT_SEL_IS0: Internal input 0
- TMR_SUB_INPUT_SEL_IS1: Internal input 1
- TMR_SUB_INPUT_SEL_IS2: Internal input 2
- TMR_SUB_INPUT_SEL_IS3: Internal input 3
- TMR_SUB_INPUT_SEL_C1INC: C1IRAW input detection
- TMR_SUB_INPUT_SEL_C1DF1: Filter input channel 1
- TMR_SUB_INPUT_SEL_C2DF2: Filter input channel 2
- TMR_SUB_INPUT_SEL_EXTIN: External input channel EXT

Example:

| |
|---|
| <code>tmr_trigger_input_select(TMR1, TMR_SUB_INPUT_SEL_IS0);</code> |
|---|

5.19.40 tmr_sub_sync_mode_set function

The table below describes the function tmr_sub_sync_mode_set.

Table 431. tmr_sub_sync_mode_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_sub_sync_mode_set |
| Function prototype | <code>void tmr_sub_sync_mode_set(tmr_type *tmr_x, confirm_state new_state);</code> |
| Function description | Set TMR slave timer synchronization mode |
| Input parameter 1 | <code>tmr_x</code> : selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8 or TMR9. |
| Input parameter 2 | <code>new_state</code> : indicates the status of TMR slave timer synchronization mode It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|---|
| <code>tmr_sub_sync_mode_set(TMR1, TRUE);</code> |
|---|

5.19.41 tmr_dma_request_enable function

The table below describes the function tmr_dma_request_enable.

Table 432. tmr_dma_request_enable function

| Name | Description |
|------------------------|--|
| Function name | tmr_dma_request_enable |
| Function prototype | <code>void tmr_dma_request_enable(tmr_type *tmr_x, tmr_dma_request_type dma_request, confirm_state new_state);</code> |
| Function description | Enable or disable TMR DMA request |
| Input parameter 1 | <code>tmr_x</code> : selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | <code>dma_request</code> : DMA request |
| Input parameter 3 | <code>new_state</code> : indicates the status of DMA request It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

dma_request

Select a DMA request.

TMR_OVERFLOW_DMA_REQUEST: Overflow event DMA request

TMR_C1_DMA_REQUEST: Channel 1 DMA request

| | |
|--------------------------|---------------------------|
| TMR_C2_DMA_REQUEST: | Channel 2 DMA request |
| TMR_C3_DMA_REQUEST: | Channel 3 DMA request |
| TMR_C4_DMA_REQUEST: | Channel 4 DMA request |
| TMR_HALL_DMA_REQUEST: | HALL event DMA request |
| TMR_TRIGGER_DMA_REQUEST: | Trigger event DMA request |

Example:

```
tmr_dma_request_enable(TMR1, TMR_OVERFLOW_DMA_REQUEST, TRUE);
```

5.19.42 tmr_interrupt_enable function

The table below describes the function tmr_interrupt_enable.

Table 433. tmr_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | tmr_interrupt_enable |
| Function prototype | void tmr_interrupt_enable(tmr_type *tmr_x, uint32_t tmr_interrupt, confirm_state new_state); |
| Function description | Enable or disable TMR interrupts |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_interrupt: TMR interrupts |
| Input parameter 3 | new_state: indicates the status of TMR interrupts It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_interrupt

Select a TMR interrupt

| | |
|------------------|---------------------------|
| TMR_OVF_INT: | Overflow event interrupt |
| TMR_C1_INT: | Channel 1 event interrupt |
| TMR_C2_INT: | Channel 2 event interrupt |
| TMR_C3_INT: | Channel 3 event interrupt |
| TMR_C4_INT: | Channel 4 event interrupt |
| TMR_HALL_INT: | HALL event interrupt |
| TMR_TRIGGER_INT: | Trigger event interrupt |
| TMR_BRK_INT: | Break event interrupt |

Example:

```
tmr_interrupt_enable(TMR1, TMR_OVF_INT, TRUE);
```

5.19.43 tmr_interrupt_flag_get function

The table below describes the function tmr_interrupt_flag_get.

Table 434. tmr_interrupt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_interrupt_flag_get |
| Function prototype | flag_status tmr_interrupt_flag_get (tmr_type *tmr_x, uint32_t tmr_flag); |
| Function description | Get interrupt flag status |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_flag: flag selection Refer to the “tmr_flag” description for details . |
| Output parameter | NA |
| Return value | flag_status: status of flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

tmr_flag

This is used for flag selection, including

| | |
|-------------------|--------------------------|
| TMR_OVF_FLAG: | Overflow interrupt flag |
| TMR_C1_FLAG: | Channel 1 interrupt flag |
| TMR_C2_FLAG: | Channel 2 interrupt flag |
| TMR_C3_FLAG: | Channel 3 interrupt flag |
| TMR_C4_FLAG: | Channel 4 interrupt flag |
| TMR_HALL_FLAG: | HALL interrupt flag |
| TMR_TRIGGER_FLAG: | Trigger interrupt flag |
| TMR_BRK_FLAG: | Break interrupt flag |

Example

```
if(tmr_interrupt_flag_get (TMR1, TMR_OVF_FLAG) != RESET)
```

5.19.44 tmr_flag_get function

The table below describes the function tmr_flag_get.

Table 435. tmr_flag_get function

| Name | Description |
|------------------------|--|
| Function name | tmr_flag_get |
| Function prototype | flag_status tmr_flag_get(tmr_type *tmr_x, uint32_t tmr_flag); |
| Function description | Get flag status |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_flag: flag selection Refer to the “tmr_flag” description for details . |
| Output parameter | NA |
| Return value | flag_status: status of flag Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

tmr_flag

This is used for flag selection, including

| | |
|------------------------|--------------------------|
| TMR_OVF_FLAG: | Overflow interrupt flag |
| TMR_C1_FLAG: | Channel 1 interrupt flag |
| TMR_C2_FLAG: | Channel 2 interrupt flag |
| TMR_C3_FLAG: | Channel 3 interrupt flag |
| TMR_C4_FLAG: | Channel 4 interrupt flag |
| TMR_HALL_FLAG: | HALL interrupt flag |
| TMR_TRIGGER_FLAG: | Trigger interrupt flag |
| TMR_BRK_FLAG: | Break interrupt flag |
| TMR_C1_RECAPTURE_FLAG: | Channel 1 recapture flag |
| TMR_C2_RECAPTURE_FLAG: | Channel 2 recapture flag |
| TMR_C3_RECAPTURE_FLAG: | Channel 3 recapture flag |
| TMR_C4_RECAPTURE_FLAG: | Channel 4 recapture flag |

Example:

```
if(tmr_flag_get(TMR1, TMR_OVF_FLAG) != RESET)
```

5.19.45 tmr_flag_clear function

The table below describes the function tmr_flag_clear.

Table 436. tmr_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | tmr_flag_clear |
| Function prototype | void tmr_flag_clear(tmr_type *tmr_x, uint32_t tmr_flag); |
| Function description | Clear flag |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_flag: flag selection Refer to the “tmr_flag” description for details . |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_flag_clear(TMR1, TMR_OVF_FLAG);
```

5.19.46 tmr_event_sw_trigger function

The table below describes the function tmr_event_sw_trigger.

Table 437. tmr_event_sw_trigger function

| Name | Description |
|------------------------|--|
| Function name | tmr_event_sw_trigger |
| Function prototype | void tmr_event_sw_trigger(tmr_type *tmr_x, tmr_event_trigger_type tmr_event); |
| Function description | Software triggers TMR event |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_event: select a TMR event |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_event

Set TMR events triggered by software

| | |
|----------------------|-----------------|
| TMR_OVERFLOW_SWTRIG: | Overflow event |
| TMR_C1_SWTRIG: | Channel 1 event |
| TMR_C2_SWTRIG: | Channel 2 event |
| TMR_C3_SWTRIG: | Channel 3 event |
| TMR_C4_SWTRIG: | Channel 4 event |
| TMR_HALL_SWTRIG: | HALL event |
| TMR_TRIGGER_SWTRIG: | Trigger event |

TMR_BRK_SWTRIG: Break event

Example:

```
tmr_event_sw_trigger(TMR1, TMR_OVERFLOW_SWTRIG);
```

5.19.47 tmr_output_enable function

The table below describes the function tmr_output_enable.

Table 438. tmr_output_enable function

| Name | Description |
|------------------------|---|
| Function name | tmr_output_enable |
| Function prototype | void tmr_output_enable(tmr_type *tmr_x, confirm_state new_state); |
| Function description | Enable or disable TMR output |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1 or TMR8. |
| Input parameter 2 | new_state: TMR output status It can be Enable (TRUE) or Disable (FALSE). |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_output_enable(TMR1, TRUE);
```

5.19.48 tmr_internal_clock_set function

The table below describes the function tmr_internal_clock_set.

Table 439. tmr_internal_clock_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_internal_clock_set |
| Function prototype | void tmr_internal_clock_set(tmr_type *tmr_x); |
| Function description | Set TMR internal clock |
| Input parameter | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8 or TMR9. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
tmr_internal_clock_set(TMR1);
```

5.19.49 tmr_output_channel_polarity_set function

The table below describes the function tmr_output_channel_polarity_set.

Table 440. tmr_output_channel_polarity_set function

| Name | Description |
|------------------------|---|
| Function name | tmr_output_channel_polarity_set |
| Function prototype | void tmr_output_channel_polarity_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, tmr_polarity_active_type oc_polarity); |
| Function description | Set TMR output channel polarity |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | oc_polarity: output channel polarity |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel.

- TMR_SELECT_CHANNEL_1: Timer channel 1
- TMR_SELECT_CHANNEL_1C: Complementary channel 1
- TMR_SELECT_CHANNEL_2: Timer channel 2
- TMR_SELECT_CHANNEL_2C: Complementary channel 2
- TMR_SELECT_CHANNEL_3: Timer channel 3
- TMR_SELECT_CHANNEL_3C: Complementary channel 3
- TMR_SELECT_CHANNEL_4: Timer channel 4

oc_polarity

Select TMR channel polarity.

TMR_POLARITY_ACTIVE_HIGH: Active high

TMR_POLARITY_ACTIVE_LOW: Active low

Example:

```
tmr_output_channel_polarity_set(TMR1, TMR_SELECT_CHANNEL_1, TMR_POLARITY_ACTIVE_HIGH);
```

5.19.50 tmr_external_clock_config function

The table below describes the function tmr_external_clock_config.

Table 441. tmr_external_clock_config function

| Name | Description |
|------------------------|---|
| Function name | tmr_external_clock_config |
| Function prototype | void tmr_external_clock_config(tmr_type *tmr_x, tmr_external_signal_divider_type es_divide, tmr_external_signal_polarity_type es_polarity, uint16_t es_filter); |
| Function description | Configure TMR external clock |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | es_divide: external signal frequency division factor |
| Input parameter 3 | es_polarity: external signal polarity |
| Input parameter 4 | es_filter: external signal filter value, 0x00~0x0F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

es_divide

Set TMR external signal frequency division factor

TMR_ES_FREQUENCY_DIV_1: Divided by 1

TMR_ES_FREQUENCY_DIV_2: Divided by 2

TMR_ES_FREQUENCY_DIV_4: Divided by 4

TMR_ES_FREQUENCY_DIV_8: Divided by 8

es_polarity

Select TMR external signal polarity

TMR_ES_POLARITY_NON_INVERTED: High or rising edge

TMR_ES_POLARITY_INVERTED: Low or falling edge

Example:

```
tmr_external_clock_config(TMR1, TMR_ES_FREQUENCY_DIV_1, TMR_ES_POLARITY_INVERTED, 0x0F);
```

5.19.51 tmr_external_clock_mode1_config function

The table below describes the function tmr_external_clock_mode1_config.

Table 442. tmr_external_clock_mode1_config function

| Name | Description |
|------------------------|---|
| Function name | tmr_external_clock_mode1_config |
| Function prototype | void tmr_external_clock_mode1_config(tmr_type *tmr_x, tmr_external_signal_divider_type es_divide, tmr_external_signal_polarity_type es_polarity, uint16_t es_filter); |
| Function description | Configure TMR external clock mode 1 (corresponding to external mode A in the reference manual) |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | es_divide: external signal frequency division factor |
| Input parameter 3 | es_polarity: external signal polarity |
| Input parameter 4 | es_filter: external signal filter value, 0x00~0x0F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

es_divide

Set TMR external signal frequency division factor; refer to [es_divide](#) for details.

es_polarity

Set TMR external signal polarity, refer to [es_polarity](#) for details.

Example:

```
tmr_external_clock_mode1_config(TMR1, TMR_ES_FREQUENCY_DIV_1, TMR_ES_POLARITY_INVERTED,  
0x0F);
```

5.19.52 tmr_external_clock_mode2_config function

The table below describes the function tmr_external_clock_mode2_config.

Table 443. tmr_external_clock_mode2_config function

| Name | Description |
|----------------------|---|
| Function name | tmr_external_clock_mode2_config |
| Function prototype | void tmr_external_clock_mode2_config(tmr_type *tmr_x, tmr_external_signal_divider_type es_divide, tmr_external_signal_polarity_type es_polarity, uint16_t es_filter); |
| Function description | Configure TMR external clock mode 2 (corresponding to external mode B in the reference manual) |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | es_divide: external signal frequency division factor |
| Input parameter 3 | es_polarity: external signal polarity |
| Input parameter 4 | es_filter: external signal filter value, 0x00~0x0F |
| Output parameter | NA |

| Name | Description |
|------------------------|-------------|
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

es_divide

Set TMR external signal frequency division factor; refer to [es_divide](#) for details.

es_polarity

Set TMR external signal polarity; refer to [es_polarity](#) for details.

Example:

```
tmr_external_clock_mode2_config(TMR1, TMR_ES_FREQUENCY_DIV_1, TMR_ES_POLARITY_INVERTED,
0x0F);
```

5.19.53 tmr_encoder_mode_config function

The table below describes the function tmr_encoder_mode_config.

Table 444. tmr_encoder_mode_config function

| Name | Description |
|------------------------|--|
| Function name | tmr_encoder_mode_config |
| Function prototype | void tmr_encoder_mode_config(tmr_type *tmr_x, tmr_encoder_mode_type encoder_mode, tmr_input_polarity_type ic1_polarity, tmr_input_polarity_type ic2_polarity); |
| Function description | Configure TMR encoder mode |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | encoder_mode: encoder mode |
| Input parameter 3 | ic1_polarity: input channel 1 polarity |
| Input parameter 4 | ic2_polarity: input channel 2 polarity |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

encoder_mode

Select a TMR encoder mode

TMR_ENCODER_MODE_A: Encoder mode A

TMR_ENCODER_MODE_B: Encoder mode B

TMR_ENCODER_MODE_C: Encoder mode C

ic1_polarity

Select TMR input channel 1 polarity

TMR_INPUT_RISING_EDGE: Rising edge

TMR_INPUT_FALLING_EDGE: Falling edge

TMR_INPUT_BOTH_EDGE: Both edges (Rising edge and Falling edge)

ic2_polarity

Select TMR input channel 2 polarity

TMR_INPUT_RISING_EDGE: Rising edge

TMR_INPUT_FALLING_EDGE: Falling edge

TMR_INPUT_BOTH_EDGE: Both edges (Rising edge and Falling edge)

Example:

```
tmr_encoder_mode_config(TMR1, TMR_ENCODER_MODE_A, TMR_INPUT_RISING_EDGE,
TMR_INPUT_RISING_EDGE);
```

5.19.54 tmr_force_output_set function

The table below describes the function tmr_force_output_set.

Table 445. tmr_force_output_set function

| Name | Description |
|------------------------|--|
| Function name | tmr_force_output_set |
| Function prototype | void tmr_force_output_set(tmr_type *tmr_x, tmr_channel_select_type tmr_channel, tmr_force_output_type force_output); |
| Function description | Set TMR forced output |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5, TMR8, TMR9, TMR10 or TMR11. |
| Input parameter 2 | tmr_channel: timer channel |
| Input parameter 3 | force_output: forced output level |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_channel

Select a TMR channel

TMR_SELECT_CHANNEL_1: Timer channel 1

TMR_SELECT_CHANNEL_2: Timer channel 2

TMR_SELECT_CHANNEL_3: Timer channel 3

TMR_SELECT_CHANNEL_4: Timer channel 4

force_output

Forced output level of output channels

TMR_FORCE_OUTPUT_HIGH: CxORAW forced high

TMR_FORCE_OUTPUT_LOW: CxORAW forced low

Example:

```
tmr_force_output_set(TMR1, TMR_SELECT_CHANNEL_1, TMR_FORCE_OUTPUT_HIGH);
```

5.19.55 tmr_dma_control_config function

The table below describes the function tmr_dma_control_config.

Table 446. tmr_dma_control_config function

| Name | Description |
|------------------------|---|
| Function name | tmr_dma_control_config |
| Function prototype | void tmr_dma_control_config(tmr_type *tmr_x, tmr_dma_transfer_length_type dma_length, tmr_dma_address_type dma_base_address); |
| Function description | Configure TMR DMA control |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1, TMR2, TMR3, TMR4, TMR5 or TMR8. |
| Input parameter 2 | dma_length: DMA transfer length |
| Input parameter 3 | dma_base_address: DMA transfer offset address |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

dma_length

Set DAM transfer bytes, including

TMR_DMA_TRANSFER_1BYTE: 1 byte

TMR_DMA_TRANSFER_2BYTES: 2 bytes

TMR_DMA_TRANSFER_3BYTES: 3 bytes

...

TMR_DMA_TRANSFER_17BYTES: 17 bytes

TMR_DMA_TRANSFER_18BYTES: 18 bytes

dma_base_address

Set DMA transfer offset address, starting from TMR control register 1, including

TMR_CTRL1_ADDRESS

TMR_CTRL2_ADDRESS

TMR_STCTRL_ADDRESS

TMR_IDEN_ADDRESS

TMRISTS_ADDRESS

TMR_SWEVT_ADDRESS

TMR_CM1_ADDRESS

TMR_CM2_ADDRESS

TMR_CCTRL_ADDRESS

TMR_CVAL_ADDRESS

TMR_DIV_ADDRESS

TMR_PR_ADDRESS

TMR_RPR_ADDRESS

TMR_C1DT_ADDRESS

TMR_C2DT_ADDRESS

TMR_C3DT_ADDRESS

TMR_C4DT_ADDRESS

TMR_BRK_ADDRESS

TMR_DMACTRL_ADDRESS

Example:

```
tmr_dma_control_config(TMR1, TMR_DMA_TRANSFER_8BYTES, TMR_CTRL1_ADDRESS);
```

5.19.56 tmr_brkdt_config function

The table below describes the function tmr_brkdt_config.

Table 447. tmr_brkdt_config function

| Name | Description |
|------------------------|--|
| Function name | tmr_brkdt_config |
| Function prototype | void tmr_brkdt_config(tmr_type *tmr_x, tmr_brkdt_config_type *brkdt_struct); |
| Function description | Configure TMR break mode and dead time |
| Input parameter 1 | tmr_x: selected TMR peripheral. This parameter can be TMR1 or TMR8. |
| Input parameter 2 | brkdt_struct: tmr_brkdt_config_type pointer |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

tmr_brkdt_config_type structure

tmr_brkdt_config_type is defined in the at32f413_tmr.h.

typedef struct

```
{
    uint8_t          deadline;
    tmr_brk_polarity_type   brk_polarity;
    tmr_wp_level_type      wp_level;
    confirm_state          auto_output_enable;
    confirm_state          fcsoen_state;
    confirm_state          fcsodis_state;
    confirm_state          brk_enable;
}
```

} tmr_brkdt_config_type;

deadline

Set dead time, ranging from 0x00 to 0xFF

brk_polarity

Select break input polarity

TMR_BRK_INPUT_ACTIVE_LOW: Active low

TMR_BRK_INPUT_ACTIVE_HIGH: Active high

wp_level

Set write protection level

TMR_WP_OFF: Write protection OFF

TMR_WP_LEVEL_3:

Level 3 write protection, protecting the bits below

- TMRx_BRK: DTC, BRKEN, BRKV and AOEN
- TMRx_CTRL2: CxIOS and CxCIOS

TMR_WP_LEVEL_2:

Level 2 write protection, protecting the bits below in addition to level -3 protected bits:

- TMRx_CCTRL: CxP and CxCP

- TMRx_BRK: FCSODIS and FCSOEN

TMR_WP_LEVEL_1:

Level 1 write protection, protecting the bits below in addition to level -2 protected bits:

- TMRx_CMx: CxOCTRL and CxOBEN

auto_output_enable

Enable auto output, Enable (TRUE) or Disable (FALSE)

fcsoen_state

Indicates the frozen status when main output is ON. It is used to configure the status of complementary output channels when timer is OFF and output is enabled (OEN=1).

FALSE: Disable CxOUT/CxCOUT output

TRUE: Enable CxOUT/CxCOUT output, inactive level

fcsodis_state

Indicates the frozen status when main output is OFF. It is used to configure the status of complementary output channels when timer is OFF and output is disabled (OEN=0).

FALSE: Disable CxOUT/CxCOUT output

TRUE: Enable CxOUT/CxCOUT output, idle level

brk_enable

Enable break feature, Enable (TRUE) or Disable (FALSE).

Example:

```
tmr_brkdt_config_type tmr_brkdt_config_struct;
tmr_brkdt_config_struct.brk_enable = TRUE;
tmr_brkdt_config_struct.auto_output_enable = TRUE;
tmr_brkdt_config_struct.deadtime = 0;
tmr_brkdt_config_struct.fcsodis_state = TRUE;
tmr_brkdt_config_struct.fcsoen_state = TRUE;
tmr_brkdt_config_struct.brk_polarity = TMR_BRK_INPUT_ACTIVE_HIGH;
tmr_brkdt_config_struct.wp_level = TMR_WP_OFF;
tmr_brkdt_config(TMR1, &tmr_brkdt_config_struct);
```

5.20 Universal synchronous/asynchronous receiver/transmitter (USART)

USART register structure usart_type is defined in the “at32f413_usart.h”.

```
/*
 * @brief type define usart register all
 */
typedef struct
{
    ...
} usart_type;
```

The table below gives a list of the USART registers.

Table 448. Summary of USART registers

| Register | Description |
|----------|---------------------------------|
| sts | Status register |
| dt | Data register |
| baudr | Baud rate register |
| ctrl1 | Control register 1 |
| ctrl2 | Control register 2 |
| ctrl3 | Control register 3 |
| gdiv | Guard time and divider register |

The table below gives a list of the USART library functions.

Table 449. Summary of USART library functions

| Function name | Description |
|-------------------------------|---|
| usart_reset | Reset USART peripheral registers |
| usart_init | Set baud rate, data bits and stop bits |
| usart_parity_selection_config | Parity selection |
| usart_enable | Enable USART peripherals |
| usart_transmitter_enable | Enable USART transmitter |
| usart_receiver_enable | Enable USART receiver |
| usart_clock_config | Set clock polarity and phases for synchronization |
| usart_clock_enable | Set clock output for synchronization |
| usart_interrupt_enable | Enable interrupts |
| usart_dma_transmitter_enable | Enable DMA transmitter |
| usart_dma_receiver_enable | Enable DMA receiver |
| usart_wakeup_id_set | Set wakeup ID |
| usart_wakeup_mode_set | Set wakeup mode |
| usart_receiver_mute_enable | Enable receiver mute mode |
| usart_break_bit_num_set | Set break frame length |
| usart_lin_mode_enable | Enable LIN mode |
| usart_data_transmit | Data transmit |

| | |
|------------------------------------|-------------------------------------|
| uart_data_receive | Data receive |
| uart_break_send | Send break frame |
| uart_smartcard_guard_time_set | Set smartcard guard time |
| uart_irda_smartcard_division_set | Set infrared and smartcard division |
| uart_smartcard_mode_enable | Enable smartcard mode |
| uart_smartcard_nack_set | Enable smartcard NACK |
| uart_single_line_halfduplex_select | Enable single-wire half-duplex mode |
| uart_irda_mode_enable | Enable infrared mode |
| uart_irda_low_power_enable | Enable infrared low-power mode |
| uart_hardware_flow_control_set | Enable hardware flow control |
| uart_flag_get | Get flag |
| uart_flag_clear | Clear flag |

5.20.1 usart_reset function

The table below describes the function usart_reset.

Table 450. usart_reset function

| Name | Description |
|------------------------|---|
| Function name | usart_reset |
| Function prototype | void usart_reset(usart_type* usart_x); |
| Function description | Reset USART peripheral registers |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | crm_periph_reset |

Example:

```
/* reset usart1 */
usart_reset(USART1);
```

5.20.2 usart_init function

The table below describes the function usart_init.

Table 451. usart_init function

| Name | Description |
|----------------------|---|
| Function name | usart_init |
| Function prototype | void usart_init(usart_type* usart_x, uint32_t baud_rate, usart_data_bit_num_type data_bit, usart_stop_bit_num_type stop_bit); |
| Function description | Set baud rate, data bits and stop bits. |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | baud_rate: baud rate for serial interfaces |
| Input parameter 3 | data_bit: data bit width for serial interfaces |
| Input parameter 4 | stop_bit: stop bit width for serial interfaces |

| Name | Description |
|------------------------|---|
| Output parameter | NA |
| Return value | NA |
| Required preconditions | This operation can be allowed only when external low-speed clock is disabled. |
| Called functions | NA |

data_bit

Select data bit size for serial interface communication

USART_DATA_8BITS: 8-bit

USART_DATA_9BITS: 9-bit

stop_bit

Select stop bit size for serial interface communication

USART_STOP_1_BIT: 1-bit

USART_STOP_0_5_BIT: 0.5-bit

USART_STOP_2_BIT: 2-bit

USART_STOP_1_5_BIT: 1.5-bit

Example:

```
/* configure uart param */
uart_init(USART1, 115200, USART_DATA_8BITS, USART_STOP_1_BIT);
```

5.20.3 usart_parity_selection_config function

The table below describes the function usart_parity_selection_config.

Table 452. usart_parity_selection_config function

| Name | Description |
|------------------------|---|
| Function name | usart_parity_selection_config |
| Function prototype | void usart_parity_selection_config(usart_type* usart_x, usart_parity_selection_type parity); |
| Function description | Parity selection |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | parity: parity mode for serial interface communication |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

parity

Select parity mode for serial interface communication

USART_PARITY_NONE: No parity

USART_PARITY_EVEN: Even

USART_PARITY_ODD: Odd

Example:

```
/* config usart even parity */
usart_parity_selection_config(USART1, USART_PARITY_EVEN);
```

5.20.4 usart_enable function

The table below describes the function usart_enable.

Table 453. usart_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_enable |
| Function prototype | void usart_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable USART |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: Enable (TRUE) and disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable usart1 */  
usart_enable(USART1, TRUE);
```

5.20.5 usart_transmitter_enable function

The table below describes the function usart_transmitter_enable.

Table 454. usart_transmitter_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_transmitter_enable |
| Function prototype | void usart_transmitter_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable USART transmitter |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: Enable (TRUE) and disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable usart1 transmitter */  
usart_transmitter_enable(USART1, TRUE);
```

5.20.6 usart_receiver_enable function

The table below describes the function usart_receiver_enable.

Table 455. usart_receiver_enable function

| Name | Description |
|------------------------|---|
| Function name | usart_receiver_enable |
| Function prototype | void usart_receiver_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable USART receiver |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: Enable (TRUE) and disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable usart1 receiver */
usart_receiver_enable(USART1, TRUE);
```

5.20.7 usart_clock_config function

The table below describes the function usart_clock_config.

Table 456. usart_clock_config function

| Name | Description |
|------------------------|---|
| Function name | usart_clock_config |
| Function prototype | void usart_clock_config(usart_type* usart_x, usart_clock_polarity_type clk_pol, usart_clock_phase_type clk_pha, usart_lbc_type clk_lb); |
| Function description | Configure clock polarity and phase for synchronization feature |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | clk_pol: clock polarity for synchronization |
| Input parameter 3 | clk_pha: clock phase for synchronization |
| Input parameter 4 | clk_lb: selects whether to output clock on the last bit (upper bit) of data sent through synchronization feature |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

clk_pol

Clock polarity selection

USART_CLOCK_POLARITY_LOW: Low

USART_CLOCK_POLARITY_HIGH: High

clk_pha

Clock phase selection

USART_CLOCK_PHASE_1EDGE: 1st edge

USART_CLOCK_PHASE_2EDGE: 2nd edge

clk_lb

Select whether to output clock on the last bit of data

USART_CLOCK_LAST_BIT_NONE: No clock output

USART_CLOCK_LAST_BIT_OUTPUT: Clock output

Example:

```
/* config synchronous mode */
usart_clock_config(USART1, USART_CLOCK_POLARITY_HIGH, USART_CLOCK_PHASE_2EDGE,
USART_CLOCK_LAST_BIT_OUTPUT);
```

5.20.8 usart_clock_enable function

The table below describes the function usart_clock_enable.

Table 457. usart_clock_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_clock_enable |
| Function prototype | void usart_clock_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable clock output |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable clock */
usart_clock_enable(USART1, TRUE);
```

5.20.9 usart_interrupt_enable function

The table below describes the function usart_interrupt_enable.

Table 458. usart_interrupt_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_interrupt_enable |
| Function prototype | void usart_interrupt_enable(usart_type* usart_x, uint32_t usart_int, confirm_state new_state); |
| Function description | Enable interrupts |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | usart_int: interrupt type |
| Input parameter 3 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

usart_int

Select a peripheral interrupt

USART_IDLE_INT: Bus idle

| | |
|------------------|----------------------------|
| USART_RDBF_INT: | Receive data buff full |
| USART_TDC_INT: | Transmit data complete |
| USART_TDDE_INT: | Transmit data buff empty |
| USART_PERR_INT: | Parity error |
| USART_BF_INT: | Break frame receive |
| USART_ERR_INT: | Error interrupt |
| USART_CTSCF_INT: | CTS (Clear To Send) change |

Example:

```
/* enable usart1 transmit complete interrupt */
usart_interrupt_enable (USART1, USART_TDC_INT, TRUE);
```

5.20.10 usart_dma_transmitter_enable function

The table below describes the function usart_dma_transmitter_enable.

Table 459. usart_dma_transmitter_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_dma_transmitter_enable |
| Function prototype | void usart_dma_transmitter_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable DMA transmitter |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable dma transmitter */
usart_dma_transmitter_enable (USART1, TRUE);
```

5.20.11 usart_dma_receiver_enable function

The table below describes the function usart_dma_receiver_enable.

Table 460. usart_dma_receiver_enable function

| Name | Description |
|------------------------|---|
| Function name | usart_dma_receiver_enable |
| Function prototype | void usart_dma_receiver_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable DMA receiver |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable dma receiver */
usart_dma_receiver_enable (USART1, TRUE);
```

5.20.12 usart_wakeup_id_set function

The table below describes the function usart_wakeup_id_set.

Table 461. usart_wakeup_id_set function

| Name | Description |
|------------------------|--|
| Function name | usart_wakeup_id_set |
| Function prototype | void usart_wakeup_id_set(usart_type* usart_x, uint8_t usart_id); |
| Function description | Set wakeup ID |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | usart_id: wakeup ID |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* config wakeup id */
usart_wakeup_id_set (USART1, 0x88);
```

5.20.13 usart_wakeup_mode_set function

The table below describes the function usart_wakeup_mode_set.

Table 462. usart_wakeup_mode_set function

| Name | Description |
|------------------------|--|
| Function name | usart_wakeup_mode_set |
| Function prototype | void usart_wakeup_mode_set(usart_type* usart_x, usart_wakeup_mode_type wakeup_mode); |
| Function description | Set wakeup mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | wakeup_mode: wakeup mode |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

wakeup_mode

Set wakeup mode to wake up from silent state.

USART_WAKEUP_BY_IDLE_FRAME: Woke up by idle frame

USART_WAKEUP_BY_MATCHING_ID: Woke up by ID matching

Example:

```
/* config usart1 wakeup mode */
usart_wakeup_mode_set (USART1, USART_WAKEUP_BY_MATCHING_ID);
```

5.20.14 usart_receiver_mute_enable function

The table below describes the function usart_receiver_mute_enable.

Table 463. usart_receiver_mute_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_receiver_mute_enable |
| Function prototype | void usart_receiver_mute_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable USART receiver mute mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* config receiver mute */
usart_receiver_mute_enable (USART1, TRUE);
```

5.20.15 usart_break_bit_num_set function

The table below describes the function usart_break_bit_num_set.

Table 464. usart_break_bit_num_set function

| Name | Description |
|------------------------|--|
| Function name | usart_break_bit_num_set |
| Function prototype | void usart_break_bit_num_set(usart_type* usart_x, usart_break_bit_num_type break_bit); |
| Function description | Set USART break frame length |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | break_bit: break frame length type |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

break_bit

Set break frame length.

USART_BREAK_10BITS: 10 bits

USART_BREAK_11BITS: 11 bits

Example:

```
/* config break frame length 10bits */
usart_break_bit_num_set (USART1, USART_BREAK_10BITS);
```

5.20.16 usart_lin_mode_enable function

The table below describes the function usart_lin_mode_enable.

Table 465. usart_lin_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | usart_lin_mode_enable |
| Function prototype | void usart_lin_mode_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable LIN mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable usart1 lin mode */
usart_lin_mode_enable (USART1, TRUE);
```

5.20.17 usart_data_transmit function

The table below describes the function usart_data_transmit.

Table 466. usart_data_transmit function

| Name | Description |
|------------------------|--|
| Function name | usart_data_transmit |
| Function prototype | void usart_data_transmit(usart_type* usart_x, uint16_t data); |
| Function description | Transmit data |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | data: data to send |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* transmit data */
uint16_t data = 0x88;
usart_data_transmit (USART1, data);
```

5.20.18 usart_data_receive function

The table below describes the function usart_data_receive.

Table 467. usart_data_receive function

| Name | Description |
|--------------------|---|
| Function name | usart_data_receive |
| Function prototype | uint16_t usart_data_receive(usart_type* usart_x); |

| Name | Description |
|------------------------|--|
| Function description | Receive data |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | uint16_t: return the received data |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* receive data */
uint16_t data = 0;
data = usart_data_receive (USART1);
```

5.20.19 usart_break_send function

The table below describes the function usart_break_send.

Table 468. usart_break_send function

| Name | Description |
|------------------------|--|
| Function name | usart_break_send |
| Function prototype | void usart_break_send(usart_type* usart_x); |
| Function description | Send break frame |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* send break frame */
usart_break_send (USART1);
```

5.20.20 usart_smartcard_guard_time_set function

The table below describes the function usart_smartcard_guard_time_set.

Table 469. usart_smartcard_guard_time_set function

| Name | Description |
|------------------------|---|
| Function name | usart_smartcard_guard_time_set |
| Function prototype | void usart_smartcard_guard_time_set(usart_type* usart_x, uint8_t guard_time_val); |
| Function description | Set smartcard guard time |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | guard_time_val: guard time, 0x00~0xFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |

| Name | Description |
|------------------|-------------|
| Called functions | NA |

Example:

```
/* usart guard time set to 2 bit */
usart_smartcard_guard_time_set(USART1, 0x2);
```

5.20.21 usart_irda_smartcard_division_set function

The table below describes the function usart_irda_smartcard_division_set.

Table 470. usart_irda_smartcard_division_set function

| Name | Description |
|------------------------|---|
| Function name | usart_irda_smartcard_division_set |
| Function prototype | void usart_irda_smartcard_division_set(usart_type* usart_x, uint8_t div_val); |
| Function description | Infrared and smartcard frequency division settings |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | div_val: division value |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* usart clock set to (apbclk / (2 * 20)) */
usart_irda_smartcard_division_set(USART1, 20);
```

5.20.22 usart_smartcard_mode_enable function

The table below describes the function usart_smartcard_mode_enable.

Table 471. usart_smartcard_mode_enable function

| Name | Description |
|------------------------|---|
| Function name | usart_smartcard_mode_enable |
| Function prototype | void usart_smartcard_mode_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable smartcode mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the smartcard mode */
usart_smartcard_mode_enable(USART1, TRUE);
```

5.20.23 usart_smartcard_nack_set function

The table below describes the function usart_smartcard_nack_set.

Table 472. usart_smartcard_nack_set function

| Name | Description |
|------------------------|--|
| Function name | usart_smartcard_nack_set |
| Function prototype | void usart_smartcard_nack_set(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable smartcard NACK |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable the nack transmission */
usart_smartcard_nack_set(USART1, TRUE);
```

5.20.24 usart_single_line_halfduplex_select function

The table below describes the function usart_single_line_halfduplex_select.

Table 473. usart_single_line_halfduplex_select function

| Name | Description |
|------------------------|---|
| Function name | usart_single_line_halfduplex_select |
| Function prototype | void usart_single_line_halfduplex_select(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable single-wire half-duplex mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable halfduplex */
usart_single_line_halfduplex_select(USART1, TRUE);
```

5.20.25 usart_irda_mode_enable function

The table below describes the function usart_irda_mode_enable.

Table 474. usart_irda_mode_enable function

| Name | Description |
|------------------------|--|
| Function name | usart_irda_mode_enable |
| Function prototype | void usart_irda_mode_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable infrared mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable irda mode */
usart_irda_mode_enable(USART1, TRUE);
```

5.20.26 usart_irda_low_power_enable function

The table below describes the function usart_irda_low_power_enable.

Table 475. usart_irda_low_power_enable function

| Name | Description |
|------------------------|---|
| Function name | usart_irda_low_power_enable |
| Function prototype | void usart_irda_low_power_enable(usart_type* usart_x, confirm_state new_state); |
| Function description | Enable infrared low-power mode |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | new_state: enable (TRUE) or disable (FALSE) |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
/* enable irda lowpower mode */
usart_irda_low_power_enable (USART1, TRUE);
```

5.20.27 usart_hardware_flow_control_set function

The table below describes the function usart_hardware_flow_control_set.

Table 476. usart_hardware_flow_control_set function

| Name | Description |
|------------------------|---|
| Function name | usart_hardware_flow_control_set |
| Function prototype | void usart_hardware_flow_control_set(usart_type* usart_x, usart_hardware_flow_control_type flow_state); |
| Function description | Set peripheral hardware flow control |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | flow_state: flow control type |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flow_state

| | |
|------------------------------|--------------------------|
| USART_HARDWARE_FLOW_NONE: | No hardware flow control |
| USART_HARDWARE_FLOW_RTS: | RTS |
| USART_HARDWARE_FLOW_CTS: | CTS |
| USART_HARDWARE_FLOW_RTS_CTS: | RTS and CTS |

Example:

```
/* hardware flow set none */
usart_hardware_flow_control_set (USART1, USART_HARDWARE_FLOW_NONE);
```

5.20.28 usart_flag_get function

The table below describes the function usart_flag_get.

Table 477. usart_flag_get function

| Name | Description |
|------------------------|--|
| Function name | usart_flag_get |
| Function prototype | flag_status usart_flag_get(usart_type* usart_x, uint32_t flag); |
| Function description | Get flag status |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | flag: flag |
| Output parameter | NA |
| Return value | flag_status: SET or RESET |
| Required preconditions | NA |
| Called functions | NA |

flag

| | |
|-------------------|---------------------------------|
| USART_CTSCF_FLAG: | CTS (Clear To Send) change flag |
| USART_BFF_FLAG: | Break frame receive flag |
| USART_TDBE_FLAG: | Transmit buff empty flag |
| USART_TDC_FLAG: | Transmit complete flag |
| USART_RDBF_FLAG: | Receive data buff full flag |
| USART_IDLEF_FLAG: | Idle frame flag |

| | |
|-------------------|-----------------------|
| USART_ROERR_FLAG: | Receive overflow flag |
| USART_NERR_FLAG: | Noise error flag |
| USART_FERR_FLAG: | Frame error flag |
| USART_PERR_FLAG: | Parity error flag |

Example:

```
/* wait data transmit complete flag */
while(usart_flag_get (USART1, USART_TDC_FLAG) == RESET);
```

5.20.29 usart_interrupt_flag_get function

The table below describes the function usart_interrupt_flag_get.

Table 478. usart_interrupt_flag_get function

| Name | Description |
|------------------------|---|
| Function name | usart_interrupt_flag_get |
| Function prototype | flag_status usart_interrupt_flag_get(usart_type* usart_x, uint32_t flag); |
| Function description | Check if the selected flag is set or not |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2... |
| Input parameter 2 | flag: flag selection |
| Output parameter | NA |
| Return value | flag_status: SET or RESET |
| Required preconditions | NA |
| Called functions | NA |

flag

| | |
|-------------------|---------------------------------|
| USART_CTSCF_FLAG: | CTS (Clear To Send) change flag |
| USART_BFF_FLAG: | Break frame receive flag |
| USART_TDBE_FLAG: | Transmit buff empty flag |
| USART_TDC_FLAG: | Transmit complete flag |
| USART_RDBF_FLAG: | Receive data buff full flag |
| USART_IDLEF_FLAG: | Idle frame flag |
| USART_ROERR_FLAG: | Receive overflow flag |
| USART_NERR_FLAG: | Noise error flag |
| USART_FERR_FLAG: | Frame error flag |
| USART_PERR_FLAG: | Parity error flag |

Example

```
/* check received data flag */
if(usart_interrupt_flag_get(USART1, USART_RDBF_FLAG) != RESET)
{
}
```

5.20.30 usart_flag_clear function

The table below describes the function usart_flag_clear.

Table 479. usart_flag_clear function

| Name | Description |
|------------------------|--|
| Function name | usart_flag_clear |
| Function prototype | void usart_flag_clear(usart_type* usart_x, uint32_t flag); |
| Function description | Clear flag |
| Input parameter 1 | usart_x: selected peripherals. It can be USART1, USART2 or USART3... |
| Input parameter 2 | flag: to-be-cleared flag |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

flag

USART_CTSCF_FLAG: CTS (Clear To Send) change flag

USART_BFF_FLAG: Break frame receive flag

USART_TDC_FLAG: Transmit complete flag

USART_RDBF_FLAG: Receive data buff full flag

Example:

```
/* clear data transmit complete flag */
usart_flag_clear (USART1, USART_TDC_FLAG );
```

5.21 Watchdog timer (WDT)

The WDT register structure `wdt_type` is defined in the “`at32f413_wdt.h`”.

```
/*
 * @brief type define wdt register all
 */
typedef struct
{
} wdt_type;
```

The table below gives a list of the WDT registers.

Table 480. Summary of WDT registers

| Register | Description |
|----------|------------------|
| cmd | Command register |
| div | Divider register |
| rld | Reload register |
| sts | Status register |

The table below gives a list of the WDT library functions.

Table 481. Summary of WDT library functions

| Function name | Description |
|--|--|
| <code>wdt_enable</code> | Enable watchdog |
| <code>wdt_counter_reload</code> | Reload counter |
| <code>wdt_reload_value_set</code> | Set reload value |
| <code>wdt_divider_set</code> | Set division value |
| <code>wdt_register_write_enable</code> | Unlock WDT_DIV and WDT_RLD register write protection |
| <code>wdt_flag_get</code> | Get flag |

5.21.1 `wdt_enable` function

The table below describes the function `wdt_enable`.

Table 482. `wdt_enable` function

| Name | Description |
|------------------------|-------------------------------------|
| Function name | <code>wdt_enable</code> |
| Function prototype | <code>void wdt_enable(void);</code> |
| Function description | Enable watchdog |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wdt_enable();
```

5.21.2 **wdt_counter_reload** function

The table below describes the function `wdt_counter_reload`.

Table 483. `wdt_counter_reload` function

| Name | Description |
|------------------------|---|
| Function name | <code>wdt_counter_reload</code> |
| Function prototype | <code>void wdt_counter_reload(void);</code> |
| Function description | Reload counter |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wdt_counter_reload();
```

5.21.3 **wdt_reload_value_set** function

The table below describes the function `wdt_reload_value_set`.

Table 484. `wdt_reload_value_set` function

| Name | Description |
|------------------------|--|
| Function name | <code>wdt_reload_value_set</code> |
| Function prototype | <code>void wdt_reload_value_set(uint16_t reload_value);</code> |
| Function description | Set reload value |
| Input parameter 1 | reload_value: reload value, 0x000~0xFFFF |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wdt_reload_value_set(0xFFFF);
```

5.21.4 wdt_divider_set function

The table below describes the function wdt_divider_set.

Table 485. wdt_divider_set function

| Name | Description |
|------------------------|--|
| Function name | wdt_divider_set |
| Function prototype | void wdt_divider_set(wdt_division_type division); |
| Function description | Set division value |
| Input parameter 1 | division: watchdog division value Refer to the following “division” descriptions for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

division

Select watchdog division value

| | |
|------------------|----------------|
| WDT_CLK_DIV_4: | Divided by 4 |
| WDT_CLK_DIV_8: | Divided by 8 |
| WDT_CLK_DIV_16: | Divided by 16 |
| WDT_CLK_DIV_32: | Divided by 32 |
| WDT_CLK_DIV_64: | Divided by 64 |
| WDT_CLK_DIV_128: | Divided by 128 |
| WDT_CLK_DIV_256: | Divided by 256 |

Example:

```
wdt_divider_set(WDT_CLK_DIV_4);
```

5.21.5 wdt_register_write_enable function

The table below describes the function wdt_register_write_enable.

Table 486. wdt_register_write_enable function

| Name | Description |
|------------------------|---|
| Function name | wdt_register_write_enable |
| Function prototype | void wdt_register_write_enable(confirm_state new_state); |
| Function description | Unlock WDT_DIV and WDT_RLD write protection |
| Input parameter 1 | new_state: unlock register write protection This parameter can be TRUE or FALSE. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wdt_register_write_enable(TRUE);
```

5.21.6 wdt_flag_get function

The table below describes the function wdt_flag_get.

Table 487. wdt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | wdt_flag_get |
| Function prototype | flag_status wdt_flag_get(uint16_t wdt_flag); |
| Function description | Get flag status |
| Input parameter 1 | flag: flag selection Refer to the “flag” description for details. |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

flag

This is used for flag selection, including

WDT_DIVF_UPDATE_FLAG: Division value update complete

WDT_RLDF_UPDATE_FLAG: Reload value update complete

Example:

```
wdt_flag_get(WDT_DIVF_UPDATE_FLAG);
```

5.22 Window watchdog timer (WWDT)

The WWDT register structure wwdt_type is defined in the “at32f413_wwdt.h”.

```
/*
 * @brief type define wwdt register all
 */
typedef struct
{

} wwdt_type;
```

The table below gives a list of the WWDT registers.

Table 488. Summary of WWDT registers

| Register | Description |
|----------|------------------------|
| ctrl | Control register |
| cfg | Configuration register |
| sts | Status register |

The table below gives a list of the WWDT library functions.

Table 489. Summary of WWDT library functions

| Function name | Description |
|-------------------------|-------------------------------------|
| wwdt_reset | Reset window watchdog registers |
| wwdt_divider_set | Set divider |
| wwdt_flag_clear | Clear reload counter interrupt flag |
| wwdt_enable | Enable WWDT |
| wwdt_interrupt_enable | Enable reload counter interrupt |
| wwdt_flag_get | Get flag |
| wwdt_counter_set | Set counter value |
| wwdt_window_counter_set | Set window value |

5.22.1 wwdt_reset function

The table below describes the function wwdt_reset.

Table 490. wwdt_reset function

| Name | Description |
|------------------------|--|
| Function name | wwdt_reset |
| Function prototype | void wwdt_reset(void); |
| Function description | Reset window watchdog registers to their initial values |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | void crm_periph_reset(crm_periph_reset_type value, confirm_state new_state); |

Example:

```
wwdt_reset();
```

5.22.2 wwdt_divider_set function

The table below describes the function wwdt_divider_set.

Table 491. wwdt_divider_set function

| Name | Description |
|------------------------|--|
| Function name | wwdt_divider_set |
| Function prototype | void wwdt_divider_set(wwdt_division_type division); |
| Function description | Set divider |
| Input parameter 1 | division: WWDT division value Refer to the following "division" descriptions for details. |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

division

Select WWDT division value

- | | |
|-----------------------|------------------|
| WWDT_PCLK1_DIV_4096: | Divided by 4096 |
| WWDT_PCLK1_DIV_8192: | Divided by 8192 |
| WWDT_PCLK1_DIV_16384: | Divided by 16384 |
| WWDT_PCLK1_DIV_32768: | Divided by 32768 |

Example:

```
wwdt_divider_set(WWDT_PCLK1_DIV_4096);
```

5.22.3 wwdt_enable function

The table below describes the function wwdt_enable.

Table 492. wwdt_enable function

| Name | Description |
|------------------------|---|
| Function name | wwdt_enable |
| Function prototype | void wwdt_enable(uint8_t wwdt_cnt); |
| Function description | Enable WWDT |
| Input parameter 1 | wwdt_cnt: WWDT counter initial value, 0x40~0x7F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wwdt_enable(0x7F);
```

5.22.4 wwdt_interrupt_enable function

The table below describes the function wwdt_interrupt_enable.

Table 493. wwdt_interrupt_enable function

| Name | Description |
|------------------------|-----------------------------------|
| Function name | wwdt_interrupt_enable |
| Function prototype | void wwdt_interrupt_enable(void); |
| Function description | Enable reload counter interrupt |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|--------------------------|
| wwdt_interrupt_enable(); |
|--------------------------|

5.22.5 wwdt_counter_set function

The table below describes the function wwdt_counter_set.

Table 494. wwdt_counter_set function

| Name | Description |
|------------------------|--|
| Function name | wwdt_counter_set |
| Function prototype | void wwdt_counter_set(uint8_t wwdt_cnt); |
| Function description | Set counter value |
| Input parameter 1 | wwdt_cnt: WWDT counter value, 0x40~0x7F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

| |
|-------------------------|
| wwdt_counter_set(0x7F); |
|-------------------------|

5.22.6 wwdt_window_counter_set function

The table below describes the function wwdt_window_counter_set.

Table 495. wwdt_window_counter_set function

| Name | Description |
|------------------------|---|
| Function name | wwdt_window_counter_set |
| Function prototype | void wwdt_window_counter_set(uint8_t window_cnt); |
| Function description | Set window value |
| Input parameter 1 | wwdt_cnt: WWDT window value, 0x40~0x7F |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |

| Name | Description |
|------------------|-------------|
| Called functions | NA |

Example:

```
wwdt_window_counter_set(0x6F);
```

5.22.7 wwdt_flag_get function

The table below describes the function wwdt_flag_get.

Table 496. wwdt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | wwdt_flag_get |
| Function prototype | flag_status wwdt_flag_get(void); |
| Function description | Get reload counter interrupt flag |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wwdt_flag_get();
```

5.22.8 wwdt_interrupt_flag_get function

The table below describes the function wwdt_interrupt_flag_get.

Table 497. wwdt_interrupt_flag_get function

| Name | Description |
|------------------------|--|
| Function name | wwdt_interrupt_flag_get |
| Function prototype | flag_status wwdt_interrupt_flag_get(void); |
| Function description | Get reload counter interrupt flag and judge the corresponding interrupt enable bit |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | flag_status: flag status Return SET or RESET. |
| Required preconditions | NA |
| Called functions | NA |

Example

```
wwdt_interrupt_flag_get();
```

5.22.9 wwdt_flag_clear function

The table below describes the function wwdt_flag_clear.

Table 498. wwdt_flag_clear function

| Name | Description |
|------------------------|-------------------------------------|
| Function name | wwdt_flag_clear |
| Function prototype | void wwdt_flag_clear(void); |
| Function description | Clear reload counter interrupt flag |
| Input parameter 1 | NA |
| Output parameter | NA |
| Return value | NA |
| Required preconditions | NA |
| Called functions | NA |

Example:

```
wwdt_flag_clear();
```

6 Precautions

6.1 Device model replacement

While replacing the device part number in an existing project or demo with another one, it is necessary to check the macro definitions corresponding to the device defined in Table 1 before replacement. The subsequent sections give a detailed description of how to replace a device in KEIL and IAR environments (Just taking the at32f403avgt7 as an example as other devices share similar operations).

There are two steps to get this happen:

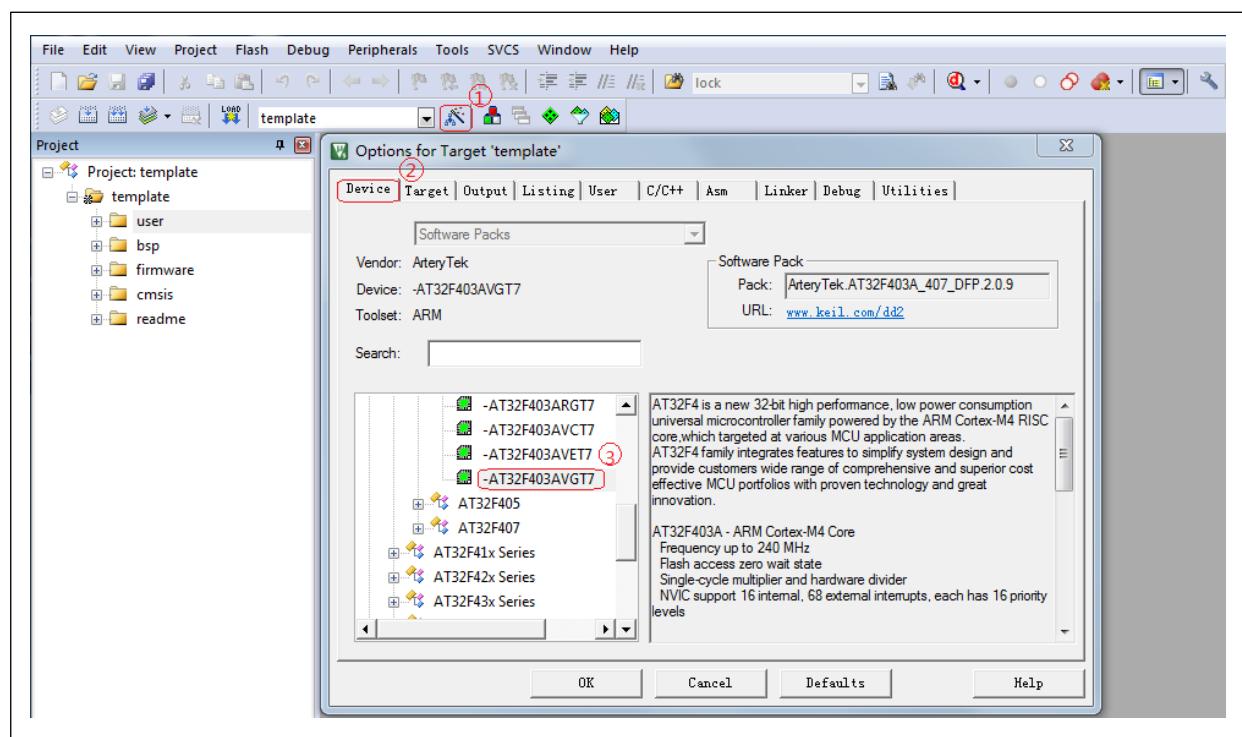

1. By changing device
2. By changing macro definition

6.1.1 KEIL environment

Follow the steps and illustration below for device replacement in Keil environment.

- ① Click on magic wand “Options for Target”
- ② Click on “Device”
- ③ Select the desired device part number

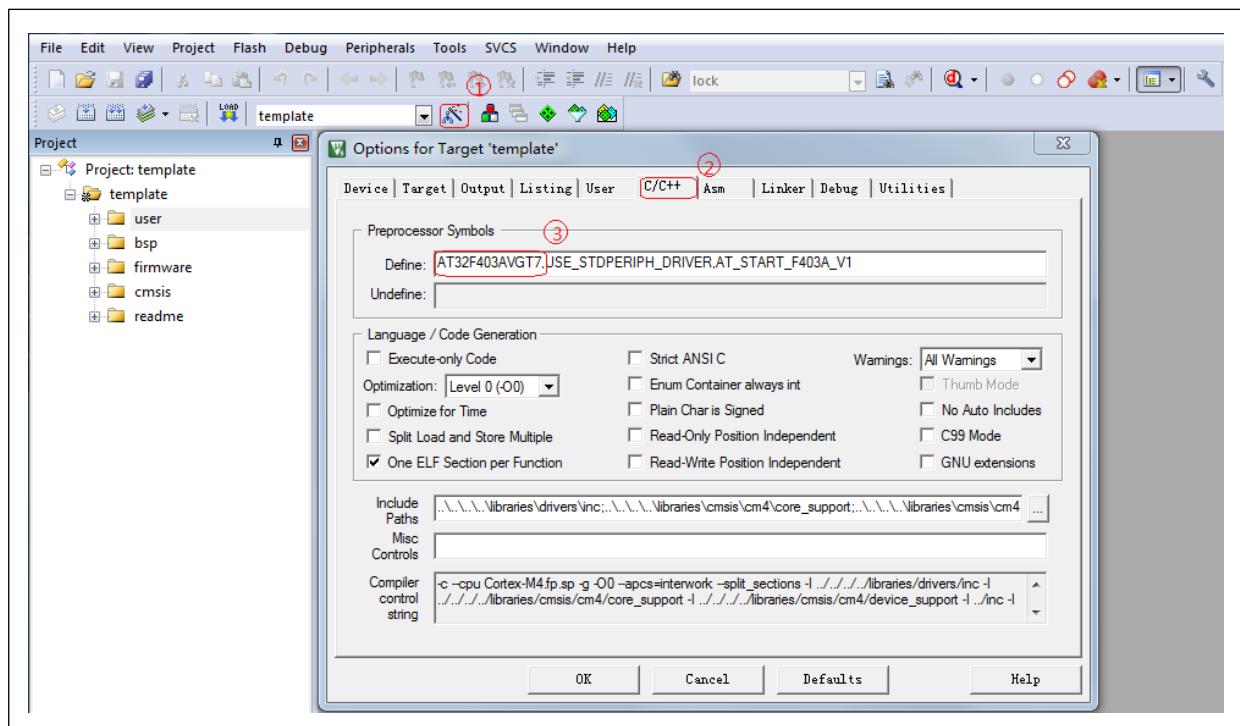

Figure 29. Change device part number in Keil

Follow the steps and illustration below to change macro definition.

- ① Click on magic wand “Options for Target”
- ② Click on “C/C++”
- ③ Delete the original macro definition in “Define” box, and write the desired one corresponding to the selected device part number based on Table 1.

Figure 30. Change macro definition in Keil

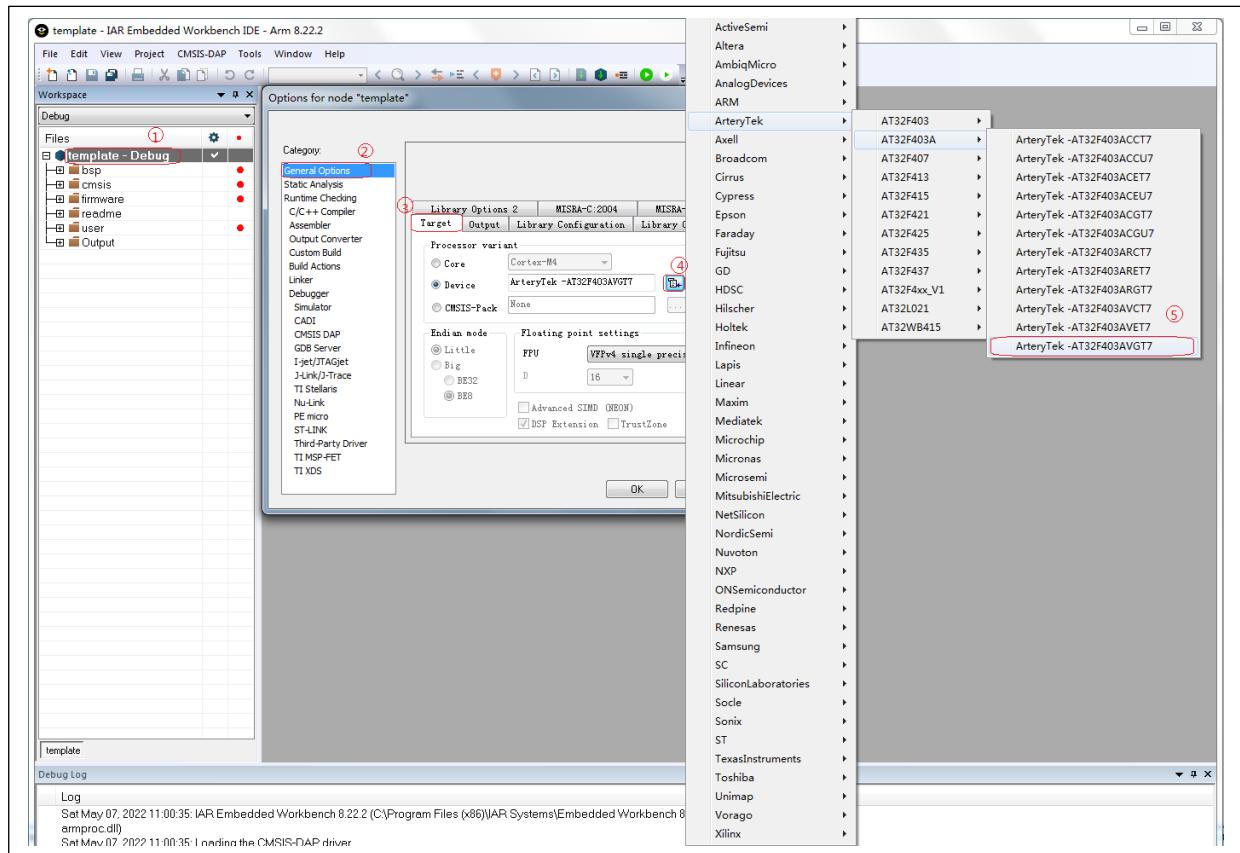

6.1.2 IAR environment

Follow the steps and illustration below for device replacement in IAR environment:

- ① Right click on the file name, and select “Options...”
- ② Select “General Options”
- ③ Select “Target”
- ④ Click on the check box
- ⑤ Select the desired device part number

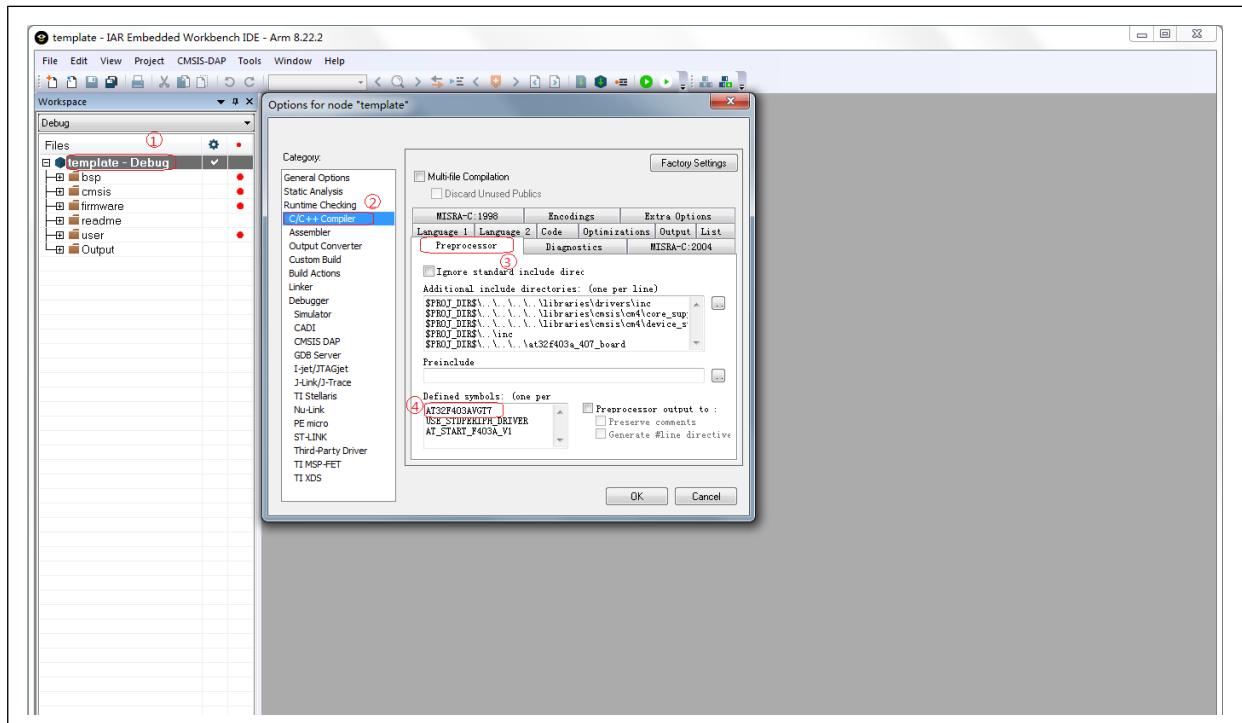

Figure 31. Change device part number in IAR

Follow the steps and illustration below to change macro definition in IAR environment:

- ① Right click on the file name, and select “Options...”
- ② Select “C/C++ Compiler”
- ③ Click on “Preprocessor”
- ④ Delete the original macro definition in “Defined symbols” column, and write the desired one corresponding to the selected device part number based on Table 1.

Figure 32. Change macro definition in IAR

6.2 Unable to identify IC by JLink software in Keil

In special circumstances, the Keil project compiled by an engineer is unknown to the J-Link software even if it can be compiled by other engineers and identified by ICP software. For example, some warnings like below will be displayed.

Figure 33. Error warning 1

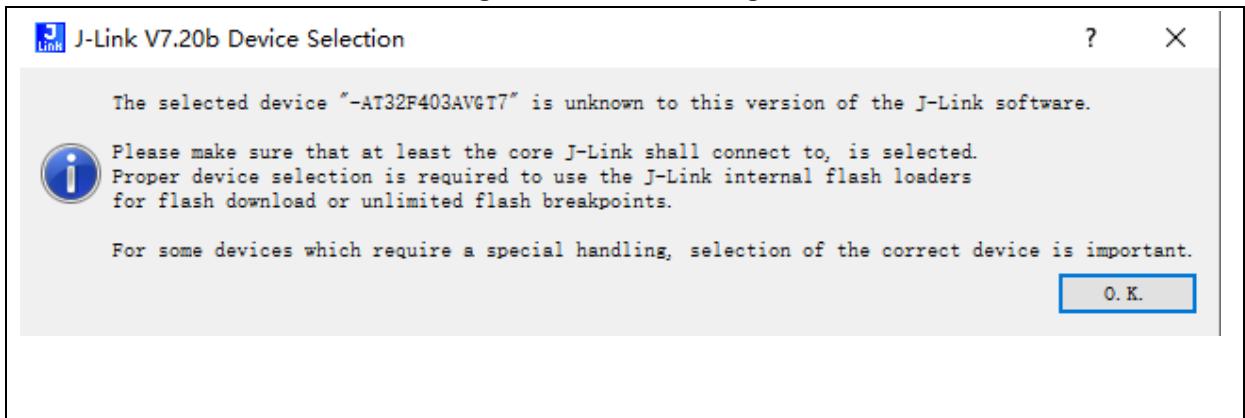

Figure 34. Error warning 2

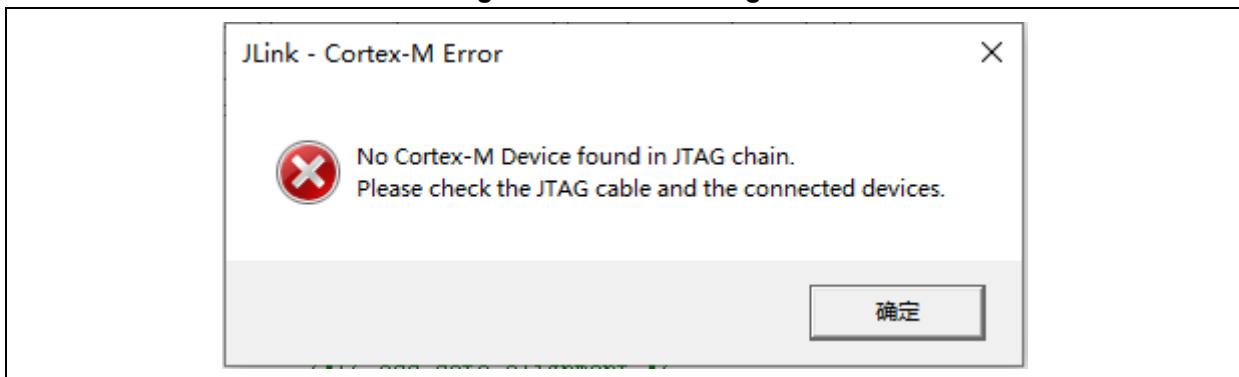

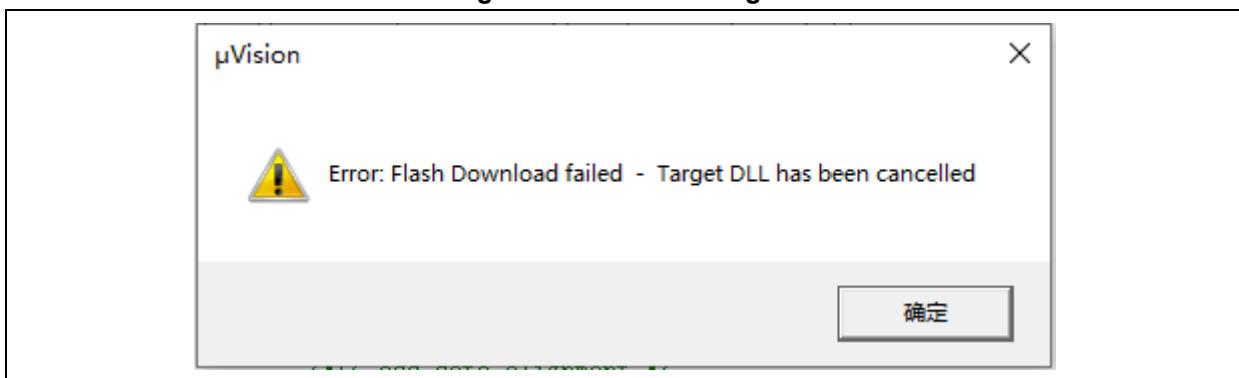

Figure 35. Error warning 3

How to solve this problem?

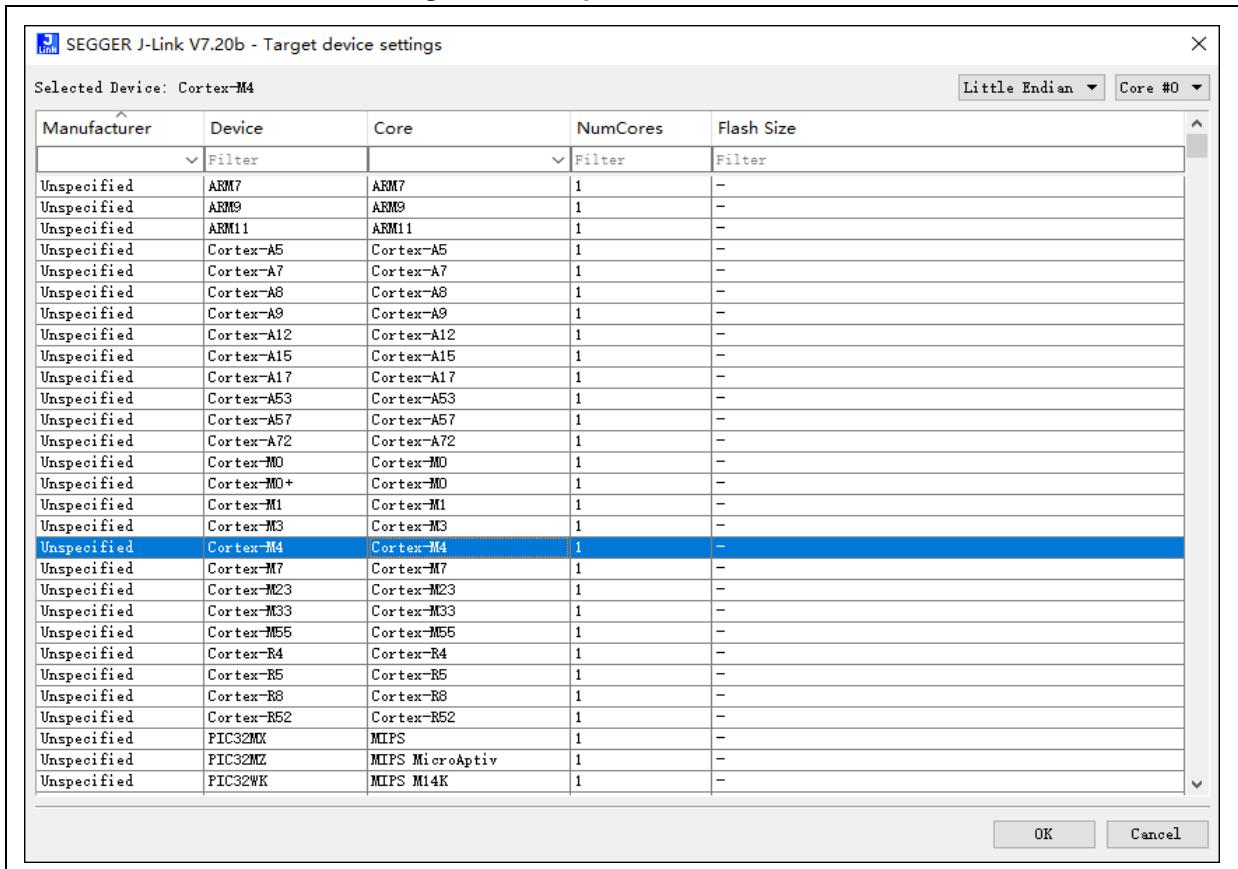

Step 1: Find “JLinkLog” and “JLinkSettings” files according to project path, and delete them.

Figure 36. JLinkLog and JLinkSettings

| AT32F403A_407_Firmware_Library > project > at_start_f403a > examples > adc > combine_i | | | |
|--|-----------------|-----------------|-------|
| 名称 | 修改日期 | 类型 | 大小 |
| listings | 2022/2/22 19:28 | 文件夹 | |
| objects | 2022/2/22 19:28 | 文件夹 | |
| combine_mode_ordinary_simult.uvoptx | 2022/2/22 19:28 | UVOPTX 文件 | 12 KB |
| combine_mode_ordinary_simult | 2022/2/22 19:28 | 礦ision5 Project | 17 KB |
| JLinkLog | 2022/2/22 19:28 | 文本文档 | 7 KB |
| JLinkSettings | 2022/2/22 19:27 | 配置设置 | 1 KB |

Step 2: Click on magic wand, go to “Debug”, select “Unspecified Cortex-M4”.

Figure 37. Unspecified Cortex-M4

6.3 How to change HEXT crystal

All examples used in BSP implements frequency multiplication based on 8 MHz external highspeed crystal oscillator on the evaluation board. If a non-8 MHz external crystal is used in actual scenarios, it is necessary to modify clock configuration in BSP to allow for accurate and stable clock frequency.

Therefore, the “AT32_New_Clock_Configuration” tool is specially developed by Artery to generate the desired BSP system clock code file, including external clock source, frequency division factor, frequency multiplication factor, clock source selection and other parameters, marked in red in Figure 38. After the completion of parameter configuration, it is ready to generate code file, avoiding complicated operations involved in code modification.

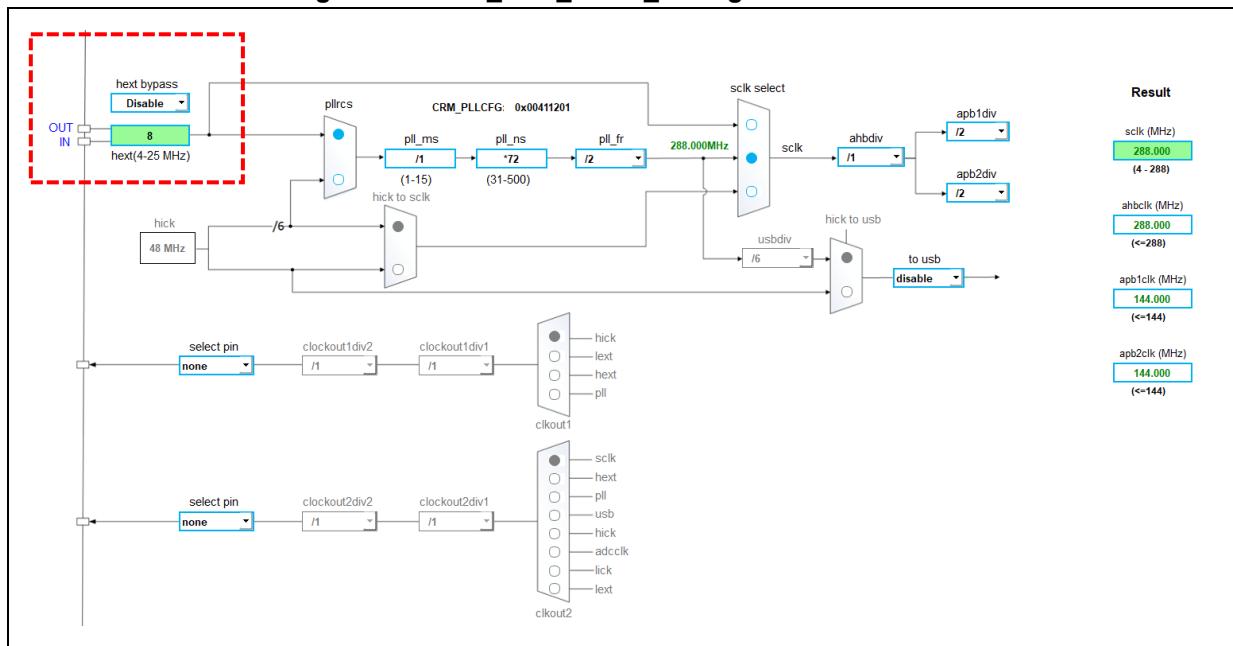

The users simply need to replace the original one in BSP demo with the newly generated clock code file (at32f4xx_clock.c/ at32f4xx_clock.h/ at32f4xx_conf.h) and call the function system_clock_config in main function.

Also, it is necessary to replace the macro definition HEXT_VALUE in the at32f4xx_conf.h. Taking the AT32F403A as an example, the HEXT_VALUE of the at32f403a_407_conf.h is defined as:

```
#define HEXT_VALUE ((uint32_t)8000000) /*!< value of the high speed exernal crystal in hz */
```

Figure 38 shows the window of AT32_New_Clock_Configuration tool.

Figure 38. AT32_New_Clock_Configuration window

For more information on the AT32_New_Clock_Configuration, please refer to the corresponding Application Note shown in the table below, which are all available from the official website of Artery.

Table 499. Clock configuration guideline

| Part number | Application note |
|-----------------------------------|------------------|
| AT32F403A/407 clock configuration | AN0082 |
| AT32F435/437 clock configuration | AN0084 |
| AT32F421 clock configuration | AN0116 |
| AT32F415 clock configuration | AN0117 |
| AT32F413 clock configuration | AN0118 |
| AT32F425 clock configuration | AN0121 |

7 Revision history

Table 500. Document revision history

| Date | Version | Revision note |
|------------|---------|--|
| 2021.11.26 | 2.0.0 | Initial release |
| 2022.06.15 | 2.0.1 | Added descriptions of peripheral library functions |
| 2022.11.15 | 2.0.2 | Modified descriptions of I2C in “abbreviations of peripherals” |
| 2023.07.18 | 2.0.3 | Added CRC related registers and functions |
| 2023.10.26 | 2.0.4 | Added interrupt_flag_get function for each IP. |
| 2024.03.01 | 2.0.5 | Changed “PWC” to “NVIC” in the titles of Table 293&294 in Section 5.13 |

IMPORTANT NOTICE – PLEASE READ CAREFULLY

Purchasers are solely responsible for the selection and use of ARTERY's products and services, and ARTERY assumes no liability whatsoever relating to the choice, selection or use of the ARTERY products and services described herein.

No license, express or implied, to any intellectual property rights is granted under this document. If any part of this document deals with any third party products or services, it shall not be deemed a license grant by ARTERY for the use of such third party products or services, or any intellectual property contained therein, or considered as a warranty regarding the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

Unless otherwise specified in ARTERY's terms and conditions of sale, ARTERY provides no warranties, express or implied, regarding the use and/or sale of ARTERY products, including but not limited to any implied warranties of merchantability, fitness for a particular purpose (and their equivalents under the laws of any jurisdiction), or infringement of any patent, copyright or other intellectual property right.

Purchasers hereby agree that ARTERY's products are not designed or authorized for use in: (A) any application with special requirements of safety such as life support and active implantable device, or system with functional safety requirements; (B) any aircraft application; (C) any aerospace application or environment; (D) any weapon application, and/or (E) or other uses where the failure of the device or product could result in personal injury, death, property damage. Purchasers' unauthorized use of them in the aforementioned applications, even if with a written notice, is solely at purchasers' risk, and Purchasers are solely responsible for meeting all legal and regulatory requirements in such use.

Resale of ARTERY products with provisions different from the statements and/or technical features stated in this document shall immediately void any warranty grant by ARTERY for ARTERY products or services described herein and shall not create or expand in any manner whatsoever, any liability of ARTERY.
